THE SENTINELS OF ENTROPY & THE OBSIDIAN ECHELON

Independent Adversarial Analysis

Microsoft 365 Copilot | Version 1.0 | October 25, 2026

Independent Adversarial Analysis - Proposal / Review Material - Not Canon - Architect Review Required

FICTION / PUBLICATION BOUNDARY

This report evaluates fictional worldbuilding and project architecture. It does not allege comparable coordination by real persons or institutions. Narrative severity is preserved, but real-world harmful procedures are not reproduced. Where prior material becomes unnecessarily operational, this report records the design problem at a non-operational level and recommends revision before public release.

1. Report Identification and Exposure Disclosure

Field	Record
Reviewer	Microsoft 365 Copilot
Architect of Record	Nathan Ashton Arik Lewis II
Report version	1.0
Report date	October 25, 2026
Canon status	Independent proposal/review material; not ONESTAMP-applied
Intended use	Architect review, cross-AI review, version-controlled storage, potential GitHub publication after review

Sources reviewed included the two prompt-generation attachments, the six initial faction dossiers previously reviewed in this workflow, and the external sources listed in Section 14. The prompt-generation corpus states that it compiles critiques and revisions from ChatGPT, Perplexity, Claude, Copilot, Gemini, and Grok and emphasizes provenance, exposure disclosure, non-consensus analysis, publication review, and matched file deliverables. [Internal source: SENTINELS OF ENTROPY AND OBSIDIAN ECHELON INDEPENDENT PROMPT GENERATION, PDF summary and DOCX.]

Exposure disclosure. I had already reviewed the six initial submissions before this adversarial pass and previously authored one of them. Consequently, I do not claim blind independence. Terms likely to have influenced this analysis include denial of recoverability, The Withheld Door, engineered foreclosure, adverse trajectory engineering, Watch/Apparatus, Floor/Ceiling, and the Adverse Continuity Directorate. To reduce anchoring, this report reconstructs the established baseline first, then tests all faction splits with the same removal and narrative-necessity criteria.

2. Executive Assessment

Principal judgment: the concepts have achieved doctrinal maturity but not identity maturity. The project now has a coherent human-scale antagonist thesis, but it still lacks a defensible canonical answer to why two factions must exist. I therefore recommend continued development of both names while temporarily refusing to canonize the division of labor between them.

- Strongest doctrinal interpretation: the shared core is deliberate opposition to recoverability. Hidden options, compounding harm, asymmetric choice, non-regard, and refusal are subordinate expressions of that deeper principle.

- Most serious conceptual risk: two well-developed labels may still describe one organization. Canonizing directorates before resolving that problem would turn provisional architecture into technical debt.
- Most serious narrative risk: an antagonist that can globally infiltrate, hide authorship, predict recovery, manipulate institutions, and continue indefinitely can become an authorial explanation for every misfortune. That weakens causality and human agency.
- Most serious publication risk: one initial dossier contains substantially more procedural detail about real-world harm, evasion, targeting, recruitment, and technological sabotage than is necessary to establish fictional menace. That material should be generalized before public release.
- Recommended direction: preserve the shared doctrine, run a doctrine proof scene plus a faction-separation proof scene, and let those tests determine whether the final architecture is Watch/Apparatus, Operations/Infrastructure, schism, or merger.

Most urgent Architect decision: decide whether the names describe two intrinsically different functions, two historical institutions with overlapping capability, or one doctrine expressed through two institutional cultures. That decision precedes stable organization charts.

3. Source and Canon Audit

The reviewed development materials consistently preserve a distinction between the established baseline and AI-generated extensions. The Grok working draft reports the baseline as two companion oppositional factions with financed/global infiltration, destabilization focus, disruption across finances, industries, electronics, and human lives, proxy/deniability practice, and a separation from THE MINUS ONE. It also states that the Obsidian Echelon shares the profile and doctrine and remains distinct from the Obsidian Supercluster. [Internal: Grok Working Draft, pp. 2-3.]

The later dossiers then diverge. Copilot proposes Sentinels as doctrine/forecasting and Echelon as capital/institutional implementation. Claude proposes the Sentinels as the Watch and Echelon as the Apparatus. ChatGPT proposes the opposite center of gravity: Sentinels as distributed operational organism and Echelon as strategic infrastructure. Gemini similarly uses a Ceiling/Floor split. Perplexity creates a provisional Adverse Continuity Directorate and explicitly refuses to identify it with either faction without Architect approval. [Internal: Copilot sec. 5; Claude sec. 8; ChatGPT sec. 7; Gemini sec. 5; Perplexity Identity and Doctrine.]

Canon/provenance rule for this report: repeated AI convergence is evidence of design pressure, not authorial approval. The prompt-generation corpus itself states that publication and AI consensus do not canonize proposals. [Internal: Prompt Generation DOCX, Source and Canon Control / Canon Rule.]

4. Current-State Assessment

Dimension	Sentinels of Entropy	Obsidian Echelon	Joint architecture
Maturity	Doctrine-rich, identity unresolved	Doctrine-rich, identity unresolved	Working doctrine / pre-bible architecture
Clarity	Strong on moral posture; weak on unique function	Strong on institutional menace; weak on unique necessity	Shared thesis clearer than division
Coherence	Moderate-high if capability limits are imposed	Moderate-high if institutional reach is bounded	Moderate; duplication remains unresolved
Distinctiveness	Low-medium on present canon baseline	Low-medium on present canon baseline	High as a pair only if differentiation survives testing
Narrative usefulness	High at human scale	High at institutional scale	High, provided not omnipotent
Canon readiness	Not ready for detailed faction bible	Not ready for detailed faction bible	Ready for doctrine decision, not structural lock
Public-release readiness	High for abstract doctrine	High for abstract doctrine	Mixed; some prior

	passages need revision

Maturity definition used here: “working doctrine / pre-bible architecture” means the core dramatic proposition can produce coherent scenes, but organization, ultimate objective, and two-faction necessity remain unsettled enough that a full canon bible would prematurely freeze alternatives.

5. Deepest-Doctrine Analysis

The terminology is best understood as layered rather than as a set of mutually exclusive doctrines:

Layer	Best current formulation	Function
Moral premise	Non-Regard	Another person’s flourishing supplies no internal reason to stop.
Governing doctrine	Denial of recoverability	Adversity should become progressively harder to reverse.
Decision pattern	The Withheld Door / engineered foreclosure	A beneficial available option is intentionally withheld or rendered inaccessible.
Dynamic	Compounding	One setback becomes conditions for later setbacks.
Planning concept	Projection planning	The organization models downstream consequences and responses at a fictional systems level.
Institutional posture	Flat refusal / persistence	Exposure or objection does not produce moral reconsideration.
Analytical umbrella	Adverse trajectory engineering	Useful descriptive phrase, but too technical to carry the emotional center alone.

Why “denial of recoverability” wins. It explains why the factions care about hidden options, compounding, repair, rights and persistence without requiring suffering to be intrinsically valuable. It also preserves the Architect’s repeated emphasis that attempts to fix a problem become opportunities for further deterioration. [Internal: ChatGPT sec. 6; Copilot sec. 4; Claude sec. 6; Architect-origin prompts reproduced across dossiers.]

Strongest counterargument: Perplexity’s asymmetric-control thesis may be deeper. Its proposed hierarchy makes control over practical options primary and dependency secondary. A faction could deny recoverability because dependence preserves control, not because irreversibility is valuable in itself. [Internal: Perplexity, Objective Hierarchy.]

My conclusion: treat “denial of recoverability” as the present best doctrine hypothesis, not canon. Test it against the control hypothesis in narrative before locking either.

6. Two-Faction Necessity Analysis

Removal test. On the present established record, removing either name does not yet make a necessary function impossible because the baseline describes substantially overlapping profiles. The necessity of two factions therefore remains unproven. The AI drafts solve that problem in incompatible ways rather than discovering an already established answer.

Model	Case for	Case against	My status
Watch / Apparatus	Names align naturally with observation versus layered institutional execution; preserves mutual dependence.	Risks turning Sentinels into analysts despite a name that could support active guarding/operations.	Strong candidate
Operations / Infrastructure	Creates clearest scene-level division: cascade operators versus sustaining system.	Duplicates familiar field-versus-headquarters logic and may make Echelon dominant by default.	Strong candidate
Historical schism	Explains similarity without forcing functional symmetry; creates ideology and rivalry.	Requires origin history that does not yet exist.	Most promising alternative

Near-identical regional/sector split	Preserves established same-profile wording.	Weak necessity; names become largely cosmetic.	Weak candidate
Merger	Eliminates redundancy immediately.	Sacrifices two established faction identities and companion-faction potential.	Fallback, not preferred
Adverse Continuity Directorate as third entity	Provides neutral architecture to hold institutional concepts without forcing them into either faction.	Adds another organization before the two existing ones are solved.	Archive as alternative, do not expand now

Independent recommendation: do not invert one AI split into canon. Instead test a historical-schism model against the two functional splits. A schism can explain why both share doctrine while developing different institutional behaviors over time. This is a new proposal for testing, not a canon claim.

7. Major Adversarial Findings Register

ID	Finding	Severity	Confidence	Response
F-01	Two-faction necessity is unproven	Without a necessity rationale, detailed org charts disguise duplication rather than resolve it.	Critical	High
F-02	Ultimate motive remains unstable	Funding, staffing, AI goals and victory conditions change depending on which motive is primary.	Critical	High
F-03	Intent is being confused with capability	Unstoppable capability removes stakes and contradicts believable dependence on institutions, people and technology.	High	High
F-04	Deniability and scale create a coordination paradox	More separation protects attribution but weakens shared information, speed and doctrinal consistency.	High	High
F-05	Profit can contradict doctrine	Financiers, ideologues and operators may rationally want different levels of deterioration.	High	High
F-06	Terminology is outrunning decisions	Vocabulary can create a false sense of maturity and make later revision expensive.	Medium	High
F-07	Human center can disappear beneath architecture	The original force came from ordinary life, meaningful options and recovery. Losing that center makes the factions generic systems villains.	High	High
F-08	Public-release specificity is inconsistent	GitHub publication can preserve menace without preserving operational mechanism.	Critical	High
F-09	Cosmological	Cross-linking can	High	High

	integration is premature	erase the factions' grounded tonal function and manufacture continuity.		
F-10	Internal entropy problem is underdeveloped	Mistrust, exploitation, compartmentalization and non-regard threaten loyalty, succession and knowledge transfer.	High	Moderate

F-01 - Two-faction necessity is unproven

Source basis / analysis: Baseline sources describe companion factions with substantially overlapping profiles; later drafts supply incompatible divisions.

Why it matters: Without a necessity rationale, detailed org charts disguise duplication rather than resolve it.

Severity: Critical. Confidence: High. Proposed response: Architect decision plus two proof scenes. Public-release suitability: Suitable for public release.

F-02 - Ultimate motive remains unstable

Source basis / analysis: Control, decline, anti-flourishing, irrecoverability, profit, domination and ideological proof all appear across drafts.

Why it matters: Funding, staffing, AI goals and victory conditions change depending on which motive is primary.

Severity: Critical. Confidence: High. Proposed response: Doctrine decision after narrative test. Public-release suitability: Suitable for public release.

F-03 - Intent is being confused with capability

Source basis / analysis: Multiple drafts emphasize refusal to stop; some formulations drift toward countering any protective response.

Why it matters: Unstoppable capability removes stakes and contradicts believable dependence on institutions, people and technology.

Severity: High. Confidence: High. Proposed response: Define hard limits and failure conditions. Public-release suitability: Suitable for public release.

F-04 - Deniability and scale create a coordination paradox

Source basis / analysis: The baseline combines global infiltration, proxies and separation.

Why it matters: More separation protects attribution but weakens shared information, speed and doctrinal consistency.

Severity: High. Confidence: High. Proposed response: Make coordination cost a canonical vulnerability. Public-release suitability: Suitable for public release.

F-05 - Profit can contradict doctrine

Source basis / analysis: Drafts agree that some harm may be unprofitable while funding must sustain persistence.

Why it matters: Financiers, ideologues and operators may rationally want different levels of deterioration.

Severity: High. Confidence: High. Proposed response: Develop internal political economy before funding canon. Public-release suitability: Suitable for public release.

F-06 - Terminology is outrunning decisions

Source basis / analysis: The corpus contains many memorable labels for overlapping concepts.

Why it matters: Vocabulary can create a false sense of maturity and make later revision expensive.

Severity: Medium. Confidence: High. Proposed response: Create candidate-term register; canonize only after function is settled. Public-release suitability: Suitable for public release.

F-07 - Human center can disappear beneath architecture

Source basis / analysis: Later dossiers increasingly focus on institutions, finance, AI and cosmology.

Why it matters: The original force came from ordinary life, meaningful options and recovery. Losing that center makes the factions generic systems villains.

Severity: High. Confidence: High. Proposed response: Require every doctrine section to map back to a human consequence and repair condition. Public-release suitability: Suitable for public release.

F-08 - Public-release specificity is inconsistent

Source basis / analysis: One dossier includes substantially more procedural descriptions of product harm, sabotage, coercive staffing and evasion than other drafts.

Why it matters: GitHub publication can preserve menace without preserving operational mechanism.

Severity: Critical. Confidence: High. Proposed response: Rewrite to purpose/effect/dependency/limitation level before release. Public-release suitability: Suitable after revision.

F-09 - Cosmological integration is premature

Source basis / analysis: Several drafts raise possible links to Nullarch, the Mule, OAL AI and other systems while source relationships remain open.

Why it matters: Cross-linking can erase the factions' grounded tonal function and manufacture continuity.

Severity: High. Confidence: High. Proposed response: No cross-project link without source recovery or Architect choice. Public-release suitability: Suitable for public release.

F-10 - Internal entropy problem is underdeveloped

Source basis / analysis: The prompt-generation review asks how an organization devoted to deterioration avoids deteriorating itself.

Why it matters: Mistrust, exploitation, compartmentalization and non-regard threaten loyalty, succession and knowledge transfer.

Severity: High. Confidence: Moderate. Proposed response: Turn internal self-corrosion into a major vulnerability or define a credible stabilizing value. Public-release suitability: Suitable for public release.

8. Contradiction and Disagreement Register

Issue	Position A	Position B	Resolution needed
Sentinel identity	Doctrine / Watch / forecasting (Claude, Copilot)	Distributed operational organism / Floor (ChatGPT, Gemini)	Architect choice or proof-scene test
Deepest doctrine	Recoverability / compounding decline (ChatGPT, Copilot, Claude)	Asymmetric control over practical options (Perplexity)	Narrative falsification test
Relationship architecture	Two differentiated companion factions	Additional ACD / possible merger / schism alternatives	Do not expand third entity until necessity is solved
Profit	Instrument that can be sacrificed	Closed-loop commercialization	Define economic constitution and internal

		emphasized in some drafts	conflict
Persistence	Will not voluntarily stop	Some drafts imply parallel infrastructure can counter any constraint	Define capability limits separate from intent
Cosmological links	Keep THE MINUS ONE separation and grounded identity	Some drafts propose many OAL cross-links	Require explicit source/Architect decision per link
Publication specificity	Functional, non-operational description	Procedural descriptions of harmful methods in one draft	Revise before public release

9. What We Are Not Asking

- What positive value, if any, do members believe they are protecting? An institution that defines itself only by negation may have difficulty reproducing loyalty across generations.
- What must remain healthy for their project to work? Markets, records, communications, expertise, law, and trust cannot all be destroyed if the factions depend on them.
- Could the two factions differ by theory of entropy rather than function: one treating decline as truth to reveal, the other treating decline as a condition to manufacture?
- What is their internal definition of a mistake? Is accidental improvement a failure, disobedience, or useful information?
- What happens when engineered adversity produces solidarity, reform, innovation or durable resilience rather than despair?
- What is their epistemic threshold for attributing success to themselves rather than coincidence? Could they become victims of their own confirmation bias?
- How does succession work when non-regard and compartmentalization erode interpersonal trust?
- What proportion of factional events must be demonstrably authored for readers to believe the pattern without making ordinary misfortune meaningless?
- What does restoration mean after exposure? Justice, compensation, reopened options, repaired records, restored trust and recovery are not the same outcome.
- What do the names mean in-universe? Are “Sentinels of Entropy” and “Obsidian Echelon” self-names, external labels, or later historical classifications?

Question most likely to change the project: What must remain functional for the factions to continue? Answering that creates the hard outer boundary of their power and may also determine why two organizations exist.

10. Unresolved Decisions and Priority

Decision	Priority	Type	Reason
Deepest doctrine	Blocking	Architectural choice	It determines objectives, success, culture and failure.
Why two factions	Blocking	Architectural choice	Without it, organization design is premature.
Hard capability limits	High priority	Architectural choice + narrative test	Needed to prevent omnipotence.
Profit constitution	High priority	Design choice informed by research	Determines internal conflict and sustainability.
Candidate terminology	Deferrable	Editorial choice	Names can remain provisional while functions stabilize.
Detailed leadership	Deferrable	Architectural choice	Premature before institutional identity is stable.
Specific cross-project links	Rejectable absent evidence	Provenance / Architect choice	Do not manufacture continuity.
Obsidian Supercluster relationship	Productively unresolved	Source recovery	Existing materials say not to conflate them.
Public-release rewrite of operational material	Blocking for publication	Safety/editorial	Needed before GitHub release of that material.

11. Competing Development Paths

Path A - Functional Dualism: Watch / Apparatus

Premise: Sentinels own doctrine, observation and projection; Echelon owns capital, institutions and implementation. Case for: strong semantic fit and clean interdependence. Case against: risks reducing Sentinels to analysts. Dependency: define how doctrine has authority without making the Echelon subordinate. Abandon if proof scenes repeatedly need Sentinels to act as the operational network.

Path B - Functional Dualism: Operations / Infrastructure

Premise: Sentinels manage cascades and field adaptation; Echelon shapes the institutional environment. Case for: clearest human-to-system escalation and strongest distinction in scene construction. Case against: familiar field/strategy split and risks making Echelon the “real” faction. Abandon if Sentinels’ role becomes merely execution of Echelon decisions.

Path C - Historical Schism

Premise: both descend from one ideological lineage but disagree about what entropy means or how decline should be sustained. Case for: explains the established same-profile wording while permitting later differentiation, rivalry and overlapping capabilities. Case against: requires origin material not yet written. This is my preferred development experiment because it can preserve both current functional models as consequences of history rather than arbitrary assignments.

Path D - Consolidation

Premise: merge the factions if narrative tests show no unique necessity. Case for: removes redundancy and complexity. Case against: discards companion-faction potential and two established names. Preserve rejected terminology and architectures as historical/internal subcultures if merger occurs.

12. Recommended Development Roadmap

Phase	Objective	Output	Validation / gate
1. Architect doctrine decision	Choose best hypothesis among recoverability, control, or another formulation	One-page doctrine memorandum	Must explain appointment example, compounding, rights, persistence and success condition
2. Two proof scenes	Test two competing faction splits using same narrative premise	Paired scene outlines	Readers must identify which faction is acting without name labels
3. Removal test	Delete each faction from each scene/world model	Necessity memo	Each surviving faction must lose a unique capability, perspective or institutional function
4. Internal entropy test	Stress loyalty, succession, coordination, finance and dissent	Failure-mode dossier	At least one credible self-limiting mechanism becomes part of design
5. Economic constitution	Define relationship among ideology, profit, subsidy and survival	Non-operational funding principles	Must explain what happens when profit and doctrine conflict
6. Technology/AI boundary	Define functional use, authority, data limitations and audit traces	AI governance brief	No omniscience; clear human/organizational responsibility
7. Provenance reconciliation	Classify terms and structures by source status	Canon decision register	No AI proposal mislabeled as Architect-origin
8. Publication review	Generalize operationally specific harmful passages and verify citations	GitHub-ready dossier set	Public-release suitability review passes
9. ONESTAMP	Submit only settled	Canon candidate package	Architect final decision

consideration	doctrine, identity and relationships

13. Material I Would Not Canonize on the Present Record

- Any fixed Watch/Apparatus or Floor/Ceiling split.
- The Adverse Continuity Directorate as a third canonical organization.
- Any named directorate, joint apex body, cult liturgy, founder, leadership tier or succession system.
- Any specific financing mechanism beyond the abstract proposition that the factions are financed and may exploit or subsidize misfortune.
- Any detailed recruitment or coercion model.
- Any cross-project relationship to Nullarch, The Mule, named OAL AI entities, the Void Sentry Orb, 1COIN or other systems unless controlling sources or Architect decisions establish it.
- Any proposition that legal or institutional protections are inherently unable to constrain them.
- Any specific medical consequence assigned to the scheduling example that the Architect did not establish.
- Any operational description of product harm, sabotage, surveillance, evasion or suppression preserved solely because it appeared in an initial dossier.
- Any doctrine term treated as canonical merely because several AIs converged on similar language.

14. External Research Check

The external research supports the analytical framework, not the existence or plausibility of a real equivalent faction. The FTC describes dark patterns as design practices that can trick or manipulate users into choices they otherwise would not make and notes concerns about obscuring or impairing consumer autonomy. This supports analysis of hidden-option and choice-environment themes without establishing malicious institutional coordination. [FTC, Bringing Dark Patterns to Light, 2022.]

NIST describes the AI Risk Management Framework as a voluntary framework intended to incorporate trustworthiness considerations into AI design, development, use and evaluation; its Generative AI Profile is a cross-sectoral companion resource. This supports treating AI governance, evaluation, human authority and risk management as explicit design questions, while not implying any particular fictional capability. [NIST AI RMF; NIST AI 600-1.]

OECD describes policy capture as public decisions being consistently or repeatedly directed away from the public interest toward a specific interest and highlights transparency, participation, accountability and organizational integrity as countermeasures. This supports institutional-influence themes and, equally importantly, provides plausible counterforces. [OECD, Preventing Policy Capture, 2017.]

15. Human-Center Test

The appointment example should remain the central diagnostic scene. The necessary fictional facts are modest: a suitable earlier appointment exists; the gatekeeper knows it; the affected person is falsely told the later date is earliest; the person therefore loses a meaningful choice. Perplexity correctly notes that a dramatic medical catastrophe is not required for the scene to matter and that the fiction should distinguish ordinary error, compromised discretion and deliberate deprivation. [Internal: Perplexity, Appointment Decision.]

What makes the event factional is not merely that the person receives a worse date. The story needs evidence of deliberate choice plus a relationship to the faction’s doctrine or institution. Otherwise the same facts remain consistent with error, scarcity or local misconduct. Meaningful repair should therefore include restoration of truthful choice and practical access, not merely exposure of wrongdoing.

16. Self-Adversarial Critique

Strongest objection to my recommendation: refusing to choose a faction split may simply delay the work. Claude/Copilot and ChatGPT/Gemini have already produced two coherent alternatives, and choosing one would let character, organization and scene design advance immediately.

How I could be wrong: I may be overvaluing conceptual purity. Fiction often discovers identity through writing, not prior taxonomy. A provisional split could generate stronger evidence than another round of analysis. My prior authorship also biases me toward the doctrine/forecasting versus institutional-implementation distinction even though this report deliberately recommends a schism experiment instead.

Evidence that would change my position: two or more independent proof scenes in which one split repeatedly yields unmistakable, non-overlapping behavior and the competing split requires explanation to remain distinct. An Architect-origin statement defining what either name means would supersede this analysis.

Strongest competing interpretation: Perplexity's control thesis. If the deepest motive is asymmetric control rather than denial of recoverability, many current doctrine terms become consequences rather than causes, and the organizational architecture should be redesigned around authority over options rather than degradation itself.

17. Cross-Review Questions

1. What is the deepest doctrine, and what evidence would falsify your answer?
2. Why must two factions exist rather than one?
3. What does "Sentinel" mean in your architecture if you are forbidden to rely on a dictionary gloss alone?
4. What does "Echelon" mean if you are forbidden to assume hierarchy automatically defines function?
5. Which prior AI proposal do you most strongly reject, and why?
6. Which part of your own recommendation is most vulnerable?
7. What is the smallest narrative test that distinguishes the competing faction models?
8. How does an organization devoted to deterioration avoid consuming its own trust, competence and continuity?
9. What must remain functional in the world for the factions to remain capable?
10. What content in the current corpus should be rewritten before public GitHub release even if it remains useful internally?

18. Decision Summary

Disposition	Material
Preserve unchanged	Established names, companion relationship, existing high-level baseline, separation from THE MINUS ONE, non-conflation with Obsidian Supercluster where established by controlling record
Preserve as Architect-origin	Human-life stakes, "they do not care," projection-plan idea, deliberate hidden better option, refusal to morally reconsider, explicit worldbuilding disclaimer
Advance for testing	Denial of recoverability, asymmetric control, Watch/Apparatus, Operations/Infrastructure, historical schism
Advance for Architect decision	Deepest doctrine, why two factions, success/end state, hard capability limits
Retain as alternative	Adverse Continuity Directorate, merger model, sector/regional split
Revise before use	Over-specific economics, recruitment, AI or operational mechanisms
Reject for now	Any unsupported cross-project identity or chain of

	command
Exclude from public release	Actionable harmful procedures, evasion methods, product-harm methods, targeting or coercion details

Final Position

I believe development should continue, but the next canon action should be narrower than a faction bible. Preserve the human-centered doctrine work; test denial of recoverability against asymmetric control; require the two factions to pass a removal test; and use narrative proof scenes to determine identity before locking hierarchy. I am highly confident that provenance and two-faction necessity are the present blocking questions, moderately confident that denial of recoverability is the best doctrine hypothesis, and deliberately uncertain about which faction split should survive. Public release should proceed only after operationally specific harmful passages are generalized.
