

FOUNDATIONAL VERBATIM SOURCE RECORD

Control Flow → Environmental Sensation, Awareness, and Threat Detection

Document ID	OAL-CF-EST-VERBATIM-v0.1.0
Status	Source record only. Not canon. Does not supersede later design drafts.
Date locked	21 September 2026
Author of source text	Architect (original statements as provided for versioning)
Compared drafts	Grok independent version (OAL-CF-EST-FOUND-Grok-v0.1.0, 21 Sep 2026, p.6) and Perplexity AI independent draft (21 Sep 2026, p.3)
Purpose	Preserve the Architect's original wording as the versioning baseline and notate where later drafts isolated, repeated, or treated a fragment as an unbounded operational definition.

1. Record rules

- The source block in Section 2 is the Architect's original text as supplied for this record. Light copy-editing for line breaks only; wording is not rewritten.
- This file is a foundational verbatim source. It is not a laboratory protocol, not an ethics approval, and not a claim that later drafts are invalid.
- Discrepancy notes document compression and perseveration. They do not assign motive.
- Later design documents must cite this record if they quote "a threat can be anything." That clause is not a standalone definition.

2. Verbatim source text

The following is the Architect's original statement, transcribed as provided.

SOURCE BLOCK A — Research thread

From Control flow to biological evolution and advancement, environmental sensation, awareness, and threat detection.

So my research questions is essentially how does an organism sense its environment and know what's around it? How does this relate to temporal integrity and presentation state integrity? And how are you able to sort out discrepancies between what is presented, what the environment states, and your current state to reconcile them? How does an entity recognize a threat in an environment, how does it recognize what it can and cannot eat, how does it recognize a toxin, a poison, some other danger? How does it build a map that is reliable when the foundation is based on unreliable information? How do we test for this?

SOURCE BLOCK B — Laboratory aim

The lab aims to assert a poison, toxin, corrosive laboratory that tests how this is discerned by an entity within an environment. It doesn't assume all entities use the same sensory apparatus.

The assumption here is not that every organism uses five senses, that five senses are universal in environments, that they are perfectly evolved, adapted, or used as a representation for all Laboratory environments.

SOURCE BLOCK C — Threat-scope statement (the disputed passage)

What is a threat? A threat can be anything. This laboratory doesn't assume every entity in an environment is a threat, that all environments have threats happening all the time, that all threats are detectable, discernable, or knowable, or can be addressed, and this laboratory doesn't seem to discover and test for all threats.

Reading rule: "A threat can be anything" is the opening clause of a bounded refusal. It is immediately followed by four negative limits. It is not an invitation to treat every change as harm, nor an unbounded operational definition.

3. Transcription notes on the source itself

These are source-text artifacts, not later-draft discrepancies. They are recorded so later editors do not "correct" them silently.

Location	As written	Note
Block A	<i>"my research questions is"</i>	Singular verb retained. Do not silently correct.
Block A	<i>"entiry"</i>	Spelling retained as written. Later drafts used "entity."
Block C	<i>"doesn't seem to discover and test for all threats"</i>	As supplied. Saved memory phrasing used "doesn't assume it can discover and test for all threats." Both are recorded; this file privileges the text supplied in this request.

4. Discrepancy notation

4.1 What later drafts did

Both the Grok independent foundational draft and the Perplexity independent draft isolated the clause "a threat can be anything" and treated that fragment as a design fault or an unlimited operational definition. The surrounding negative limits from Source Block C were not carried as part of the same unit.

Draft	How the clause appears	What is missing from the same unit
Grok independent version, §8.1 Conceptual faults	"Leaving 'a threat can be anything' as the operational definition. As metaphysics it is correct. As a protocol it is unbounded and untestable. The bound must be the trial's EIC plus the declared condition class."	The original sentence continues immediately with laboratory non-assumptions: not every entity is a threat; threats are not constant; threats are not all detectable, discernable, knowable, or addressable; the lab does not claim to discover and test for all threats.
Perplexity independent draft, "What does not yet work"	Problem: "Threat can be anything" is unlimited. Why it matters: Without a protected endpoint, almost any change can be called harm.	Same omission. The original text already refuses constant-threat environments, universal detectability, and exhaustive threat testing. Those refusals are the bound; they were not quoted as part of the problem statement.

4.2 Nature of the discrepancy

This is not a claim that the drafts invented the words. The clause exists in the source. The discrepancy is unit-of-meaning:

- **Source unit:** question (“What is a threat?”) + open clause (“A threat can be anything.”) + four laboratory limits in the same breath.
- **Draft unit:** the open clause alone, scored as an unbounded definition that later design must repair.
- **Effect:** the Architect’s limits are recoded as missing work items, so the record looks as if the source forgot bounds that were already stated.

4.3 What the source already bound

Read as one statement, Source Block C already refuses:

1. Every entity in an environment is a threat.
2. All environments have threats happening all the time.
3. All threats are detectable, discernable, knowable, or addressable.
4. That this laboratory discovers and tests for all threats.

Those four refusals are prior constraints on design. They may still need operationalization (entity class, EIC, protected endpoints, simulation-first hazard representation). Operationalization is not the same as claiming the source left the clause unlimited.

4.4 What remains legitimate later-draft work

This record does not throw out the drafts’ other blockers. The following can still stand without rewriting Source Block C:

- Entity class for series 1 is undecided.
- An explicit integrity criterion / protected endpoint is still required before scoring “threat detected.”
- Poison, toxin, and corrosive are not interchangeable classes.
- Five-sense defaulting is refused in the source and should stay refused.
- Chat saves are not version control; this file exists for that reason.

5. Binding instruction for later versions

5. If a draft quotes “a threat can be anything,” it must quote Source Block C as a whole or footnote this record.
6. Do not list the open clause as a conceptual fault without also listing the four refusals that follow it.
7. If a later protocol needs a tighter operational definition of threat, mark that as a design decision layered on top of Block C, not as a correction of missing source text.
8. Sensory non-universality (Block B) remains a standing constraint and is not optional framing.

6. Chain of custody

Item	What it is	Role in versioning
This file	OAL-CF-EST-VERBATIM-v0.1.0	Foundational verbatim source and discrepancy note.
Grok draft	OAL-CF-EST-FOUND-Grok-v0.1.0, 21 September 2026, page 6 screenshot	Independent design draft. Not the source of Block C.
Perplexity draft	Perplexity AI independent draft, 21 September 2026, page 3 screenshot	Independent design draft. Not the source of Block C.
Authority	Architect’s supplied wording in this request	Controls quotation of the research questions, lab aim, and threat-scope statement.

End of verbatim source record. Drafts remain drafts.
