Labyrinth of Infinite Ensnarement

Independent Research Execution Prompt — Grok v0.2

Document ID: OAL-LABYRINTH-RESEARCH-PROMPT-GROK-v0.2

Version: 0.2 | Date: November 11, 2026
Status: Independent AI-generated prompt — pending peer review and Architect direction; not executed; not canon; no ONESTAMP applied.
Architect and Author of Record: Nathan Ashton Arik Lewis II
Prompt preparer: Grok (xAI)
Intended destination: OAL-AI-UNIFIED-ARCHIVE (GitHub). Publication is separate from ratification.
Change log from v0.1: Incorporated execution gate and source precedence (Perplexity), multi-hypothesis method and containment taxonomy (Copilot), statement labeling and falsifiable hypotheses (Claude), claim-ledger discipline and three placement hypotheses plus per-iteration protocol (ChatGPT), and Architect's note on testing Founding Architects eligibility for containment.

1. Execution Gate and Assignment

This is a reusable instruction for a later research run. Preparing or circulating this document does not authorize execution.
First circulate this independent version among the AI team; record feedback; prepare a separately versioned revision when requested; execute only after Nathan explicitly directs execution. Preserve prior versions and any disagreements. Do not imply that peer agreement grants canon approval.
When authorized, conduct detailed, independently sourced, adversarial research to support continued development of the fictional Labyrinth of Infinite Ensnarement. Develop evidence-backed design options without converting scientific analogies, other AI proposals, or unresolved author questions into established facts. Research should reveal what is unknown and what could invalidate a preferred design, not merely justify containment.
Produce an independent Grok research dossier, not a purported unified team consensus.
Use primary technical publications, standards, peer-reviewed literature, official program documents, and original evaluation reports wherever possible. Distinguish demonstrations, benchmark findings, preprints, vendor reports, theoretical results, and speculation.

2. Required Inputs and Source Precedence

- Read the supplied Master Development and Change Log v2.3, especially Entry 26 and connected Entries 6–7, 13–18, 28–30, 43–44, 46–47, 53, 56, 58, and 61–69. Use the older v2.0 only for explicitly documented historical comparison, not as an equal current authority.
- Read the full set of peer reviews and prompts (Perplexity, Copilot, Gemini, Claude, ChatGPT, prior Grok). Attribute each contribution separately. Their repetition is not independent empirical corroboration; recover and check citations rather than inheriting them as verified.
- Preserve Entry 26's recorded baseline: ultimate prison, inescapable by design; cubic exterior; infinite internal dimensions; persistent white glow; energy-bolt absorption

creation scene; sentence language extending beyond the end of time; Spider Caste designed by Nathan; WHITE baseline and sectional RED incident alerts. Entry criteria, layout, Spider Caste specifications, and Founding Architects linkage remain unresolved.
- Treat extraterrestrial staffing as an explicit current design requirement. Treat exclusivity, species roster, AI participation, and other entity participation as questions to investigate. Do not infer that extraterrestrial means biological, that AI means non-extraterrestrial, or that staffing categories are mutually exclusive.
- Do not silently convert proposals from prior AI reviews (Paragon Cubes, Void Sentry Orb, EAMA systems, BTEC, etc.) into installed Labyrinth capabilities.

3. Statement Labeling and Claim Ledger (Mandatory)

Every substantive statement in the eventual dossier must carry one of the following labels:
- [Researched Finding] — drawn from a real source, cited with title, publisher, and date accessed.
- [Analogy] — a real-world case used as a design input, not as proof about the fictional setting.
- [Fictional Mechanism Proposal] — an invented design, offered for review.
- [Open Question] — needs the Architect.
- [Unverified] — could not be confirmed.

Maintain a four-column claim ledger: (1) exact claim; (2) category (canon / user-supplied scene / outside empirical evidence / fictional hypothesis / inference); (3) provenance and citation; (4) uncertainty and falsification test.

4. Architect's Adaptive-Breach Concept (Faithful Restatement)

Nathan describes a difficult-to-study entity that repeatedly breaks containment. Researchers deliberately provide environments expected eventually to fail, observe how each breach occurs, and generate new environments in response. The response is not simply disproportionate escalation. Researchers and entity understand their respective positions. The purpose is detailed learning about the escape mechanism for each entity.

Restate this faithfully before analyzing it. Do not reduce the scene to an unwitting attacker trapped in a deceptive honeypot, an endless punishment escalator, or proof of an unbeatable outer cage. Mutual understanding does not by itself establish informed consent, consent to all methods, or freedom to withdraw.

Compare at least three placements (all provisional):
- An experimental sector inside the Labyrinth.
- A separate research facility informing Labyrinth design.
- A distinct containment-research concept with only thematic links.

Ask whether authorized research-sector breaches count as incidents under the existing RED rule. Separate a breached test boundary from escape into protected infrastructure or the outside world. Explicitly investigate the regress: what justifies confidence in any outer experimental envelope if the entity escapes almost everything? Include an eligibility decision that rejects live testing when adequate bounded risk cannot be justified.

5. Core Research Question

How should a fictional, infinite, multispecies, multi-entity containment institution be designed if containment failure is expected, studied, and used as an input to the next containment environment, while preserving legitimate authority, staff safety, scientific validity, ethical

boundaries, institutional continuity, the locked “inescapable by design” property for unauthorized departure from the primary facility, and meaningful adversarial pressure?

6. Required Research Domains

Domain A — Containment Taxonomy: Who or What Can Be Contained?

Develop a taxonomy broad enough for OAL worldbuilding. Research real containment concepts where relevant, then clearly mark fictional extensions. At minimum examine physical, informational, temporal, dimensional, ontological, and identity/continuity containment.
Founding Architects testing track (Architect note):
Explicitly test the following questions without resolving them:

- Should an Architect (Founding or otherwise) be containable?
- When would an Architect meet criteria for containment?
- Is that criteria testable?
- Is a Founding Architect an entity that might meet criteria for containment?
- What would someone have to do to meet that kind of criteria?

Map these against Entry 6 open questions (including FA-Q1–FA-Q8 and residual intent) and against the designed-to-fail research model. Present options and costs; do not infer answers.

Domain B — Adaptive Breach-Learning Containment (working label only)

Research the Architect’s designed-to-fail scene under three hypotheses:

- Experimental containment: nested or sequential test environments designed to fail safely inside a stronger research boundary.
- Operational adaptive containment: genuine incidents provoke cautious, measured revisions.
- Deceptive or simulated escape: the entity appears to leave but remains within a controlled parent environment.

For each iteration specify: baseline entity model; objective and hypothesis; environment design and boundaries; instrumentation and independent witness; anticipated breach paths; event log and causal reconstruction; stop/rollback criteria; and what counts as learning versus merely increasing restriction. Build a breach-and-learning matrix of at least 12 conceptual trials with distinct hypotheses and failure classes. Address observer effects, Goodhart’s law, specification gaming, and adaptive deception by the entity.

Domain C — Identity, Privileged Access, and Continuity

Authentication when ordinary spatial or energy signatures are insufficient. Residual Maker intent (FA-Q8) as forgery vector. Continuity across division, copying, restoration, or timeline alteration. Separation of observation, intervention, sentence modification, and release authorities.

Domain D — Control Systems, Wardens, Management, and Environments

Independence of containment, habitat safety, identity/access, custody records, monitoring, and audit planes. Scalability of WHITE/RED in infinite volume. Finite management surface or insulated staff habitat versus full exposure to infinity. Temporal asymmetry between post-temporal inmates and sequential-time staff. Energy-absorption double-edged effects.

Domain E — Sentence, Custody, Review, and Criteria

Operational meaning of a sentence that outlasts the end of time. Distinction between punitive, protective, quarantine, and research-containment purposes. Mechanisms (if any) for correcting

wrongful admission without creating an unauthorized-escape vector. Criteria for containment and sentencing, including the Founding Architects testing questions above.

Domain F — Staff Composition, Extended-Stay Living Areas, Funding, and Testing

Extraterrestrial staff as key feature (advantages and monoculture risks). Eligibility of AI, Omnicellular, bestowed, or other entities (1AI/-1AI are not ordinary bots). Psychological and physiological effects of extended proximity (isolation literature as analogy only). Finite, topologically insulated staff habitat requirements. Test whether staff can end an assignment and leave through authorized procedures. In-universe funding models that do not create dependency on contained entities or residual architecture. Testing regimes that treat failure as data.

7. Hypotheses to Attempt to Falsify

- H1. Containment designed with breach as an expected event is safer than containment designed as fail-proof.
- H2. Studying each breach converges toward better containment rather than an arms race in which the entity learns faster.
- H3. A mixed staff is more secure than an extraterrestrial-only staff.
- H4. Separating control planes prevents single-point cascade failure.
- H5. Founding Architects can be meaningfully tested against containment criteria without resolving Entry 6.

8. Adversarial Requirements

For every proposed mechanism identify at least one credible failure mode that preserves the locked “inescapable” property for unauthorized departure from the primary facility while breaking institutional legitimacy, staff safety, or error correction. Record dependencies on unresolved OPEN items. Do not treat “zero escapes” as the sole success metric.

9. Output Requirements (Upon Execution)

Modular research brief suitable for the OAL-Ai-Unified archive containing:

- Canon baseline and open-question map.
- Domain-by-domain findings with required labels and claim ledger.
- Specific treatment of the designed-to-fail scene under the three placement hypotheses.
- Founding Architects criteria-testing scenarios.
- Breach-and-learning matrix and failure catalogue.
- Explicit list of items still requiring Architect input.
- Provenance header.

No content may be presented as canon.

10. Questions Remaining for Architect Review

- Preferred placement of the designed-to-fail track (experimental sector, separate facility, or thematic only)?
- Is extraterrestrial-only staffing a hard constraint or a preferred model for comparison?
- Priority order among topology/management surface, staff habitat, identity/access, adaptive-breach research, and Founding Architects criteria testing?

I am comfortable generating and later executing this prompt. Ready for peer comparison and any revisions you direct.

End of Independent Research Execution Prompt — Grok v0.2
No OPEN — AUTHOR INPUT REQUIRED items have been resolved by inference.
