OMNICELLULAR PHYSIOLOGY

Microsoft 365 Copilot Gen-1R Remediation

Independent Forward Recommendation with Conflicts Preserved

Control field	Value
Prepared for	Nathan Lewis, Project Architect
Prepared by	Microsoft 365 Copilot
Version	2.0 - Gen-1R remediation addendum
Date	October 28, 2026
Relationship	Preserves v1.0/v1.1 as immutable blind baseline
Scope	Correct Copilot shortcomings without forcing team consensus
Status	Independent recommendation; not shared canon

Controlling direction

The collaboration does not need one definition, one preferred architecture, or one common outcome. This document moves forward with Copilot-specific remediation while preserving contradictory contributor tracks as research evidence.

Purpose, Origin, Mission, and Aim

Purpose

This document responds to the Architect's instruction to continue without requiring consensus. It reviews the latest team responses, states where Microsoft 365 Copilot agrees and disagrees, preserves the original blind submission, and creates a bounded Gen-1R correction path for Copilot's eight families.

How the Topic Arose

The first round produced 48 architectures across six contributors. Claude's cross-AI review identified uneven depth, source discipline, versioning, quantitative treatment, repeated prose, and incompatible definitions of an Omni-cell. The later contributor responses largely favored freezing the baseline, normalizing evidence, and cross-red-teaming, but the Architect has now clarified that contributors do not need to reach the same architecture or procedural recommendation.

Mission Statement

Mission

Improve the checkability and specificity of the Copilot architecture set without rewriting the blind record, while explicitly retaining dissent on Omnicellularity, remediation scope, red-team timing, and future phase design.

What This Document Accomplishes

- Preserves Copilot v1.0 and v1.1 as historical artifacts.
- Separates correction from redesign.
- Introduces parameterized quantitative envelopes with clear status labels.
- Replaces generic repeated attack outcomes with architecture-specific failure hypotheses.
- Preserves a Copilot definition of Constitutional Omnicellularity without imposing it on other contributors.
- Defines Copilot's preferred next research sequence, including where that sequence conflicts with other recommendations.
- Keeps every substantive matrix, table, row, column, and visual in the end appendix.

Executive Position

I accept the Architect's clarification. Agreement is not a project requirement, and the project should not erase incompatible premises merely to make the portfolio easier to compare. I will therefore move forward on two parallel commitments: first, remediate the weaknesses in my own dossier; second, preserve the biological, mesoscale-module, and macro-module interpretations as distinct research lines rather than forcing an early jurisdictional ruling.

My recommendation differs from the strongest consensus in one respect: Phase 4 control work should not become a gate that prevents independent contributors from continuing research. Baseline fingerprinting and red-team preparation should proceed, but contributor-specific remediation, targeted modeling, and alternative definitions may proceed concurrently if provenance remains clear.

Review of Team Responses

What I Adopt

- From ChatGPT: immutable blind baseline, dual baseline matrices, mechanism provenance, separate architecture merit from document quality, and no fabricated 4,712 distribution.
- From Claude: verified/measured/judgment labels, explicit review limits, common archetype mapping, and independent red-team assignment.
- From Gemini: a common physical benchmark can improve comparability, but benchmark adoption must not redefine every architecture.
- From Grok: concise architecture remains useful, and expansion should be a new version rather than an overwrite.
- From Perplexity: Unknown must not be scored as Different; remediation boundaries must distinguish missing evidence from mechanism change; sparse documents must not appear novel because they omit information.

Where I Preserve Conflict

- Omni-cell definition: I keep Constitutional Omnicellularity for Copilot; I do not require Perplexity or Grok to adopt it.
- Threat benchmark: I support a common benchmark as one comparison layer, not the only valid mission model.
- Remediation: Copilot may rename a display label for clarity, but the original name remains in the blind baseline.
- Shared versus per-family rules: shared constitutions are legitimate design choices; they should be scored as shared, not rewritten merely to improve orthogonality.
- Sequencing: correction, quantitative modeling, and matrix design may proceed in parallel rather than waiting for total project-level normalization.
- Ranking: I oppose a single combined rank. Separate axes may be scored when data quality supports them.

Copilot Baseline Status and Remediation Boundary

The original files remain the blind baseline. This document is an informed addendum and cannot inherit a claim of blind independence. A remediation change may correct formatting, add assumptions, classify unknowns, add citations, derive values from unchanged mechanisms, or clarify prose. A change to substrate, topology, core wager, identity model, or primary survival mechanism requires a new architecture version.

Name collision disposition

The historical name Mosaic Covenant remains in the baseline. In this Gen-1R document, Copilot Architecture A receives the display alias Guildweave Covenant. The identifier COP-A remains stable, and the change is recorded as nomenclature only.

Copilot Definition of Omnicellularity

For Copilot’s research line, an Omni-cell is a microscopic biological or biohybrid unit with broad latent competence, local sensing, shared interoperability, bounded role plasticity, and participation in a whole-body continuity system. No individual cell must simultaneously perform every physiological role or contain a complete executable blueprint. Some capabilities may be distributed, but distributed functions must not reduce the cell to a passive conventional part.

This definition is intentionally not imposed as the sole OAL definition. Mesoscale guild modules and macro-parcel embodiments remain valid comparative tracks, but they should not silently inherit evidence claims from microscopic biological architectures.

Quantitative Modeling Standard

The values below are not measured performance. They are parameterized engineering targets or derived arithmetic used to expose limiting resources. Every value is labeled Target, Estimate, Derived, or Unknown. The physical model assumes a nominal 70 kg embodiment only for comparability. Alternative masses remain allowed and scale-sensitive.

- Target: intended design objective, not demonstrated.
- Estimate: informed assumption used for preliminary modeling.
- Derived: arithmetic result from stated assumptions.
- Unknown: insufficient basis for a defensible value.

Architecture-Specific Remediation Narratives

COP-A: Guildweave Covenant

Guildweave Covenant retains the original core wager: heterogeneous biohybrid guilds. The quantitative model is intentionally conservative and remains subordinate to the core wager rather than redefining it.

Power envelope: 110 W active; 12 W refuge [Target]

Stored energy: 6 kWh electrochemical reserve [Estimate]

Reserve endurance: 54.5 h active; 20.8 d refuge [Derived from stated power/reserve]

Thermal storage: 0.8 MJ usable thermal sink [Estimate]

Adiabatic saturation: 2.0 h at 110 W if perfectly insulated [Derived; excludes structural heat capacity and heat loss]

Repair throughput: 4 kg/day local feedstock target [Target]

First architecture-specific failure: guild interface corruption and rare-guild loss [Hypothesis]

Interpretation: the reserve-duration values are arithmetic ceilings, not biological endurance claims. Heat, waste products, redox balance, sensor degradation, cognition, and repair can terminate useful operation earlier. The primary purpose is to expose whether energy or thermal capacity fails first under the stated scenario.

COP-B: Ceramic Lattice

Ceramic Lattice retains the original core wager: mineral-organic load-bearing lattice. The quantitative model is intentionally conservative and remains subordinate to the core wager rather than redefining it.

Power envelope: 135 W active; 18 W refuge [Target]

Stored energy: 7 kWh solid-state reserve [Estimate]

Reserve endurance: 51.9 h active; 16.2 d refuge [Derived from stated power/reserve]

Thermal storage: 1.5 MJ phase storage [Estimate]

Adiabatic saturation: 3.1 h at 135 W [Derived; excludes structural heat capacity and heat loss]

Repair throughput: 5 kg/day mineral deposition target [Target]

First architecture-specific failure: microcrack-sensor blindness and fin immobilization [Hypothesis]

Interpretation: the reserve-duration values are arithmetic ceilings, not biological endurance claims. Heat, waste products, redox balance, sensor degradation, cognition, and repair can terminate useful operation earlier. The primary purpose is to expose whether energy or thermal capacity fails first under the stated scenario.

COP-C: Mycelial Relay

Mycelial Relay retains the original core wager: reroutable fibrous network. The quantitative model is intentionally conservative and remains subordinate to the core wager rather than redefining it.

Power envelope: 95 W active; 10 W refuge [Target]

Stored energy: 5 kWh distributed reserve [Estimate]

Reserve endurance: 52.6 h active; 20.8 d refuge [Derived from stated power/reserve]

Thermal storage: 0.7 MJ distributed storage [Estimate]

Adiabatic saturation: 2.0 h at 95 W [Derived; excludes structural heat capacity and heat loss]

Repair throughput: 3 kg/day strand regrowth target [Target]

First architecture-specific failure: partition divergence and bridge-node capture [Hypothesis]

Interpretation: the reserve-duration values are arithmetic ceilings, not biological endurance claims. Heat, waste products, redox balance, sensor degradation, cognition, and repair can terminate useful operation earlier. The primary purpose is to expose whether energy or thermal capacity fails first under the stated scenario.

COP-D: Phase-Core Mantle

Phase-Core Mantle retains the original core wager: phase-change-buffered hydrogel body. The quantitative model is intentionally conservative and remains subordinate to the core wager rather than redefining it.

Power envelope: 120 W active; 8 W refuge [Target]

Stored energy: 5.5 kWh chemical reserve [Estimate]

Reserve endurance: 45.8 h active; 28.6 d refuge [Derived from stated power/reserve]

Thermal storage: 2.4 MJ latent storage [Estimate]

Adiabatic saturation: 5.6 h at 120 W [Derived; excludes structural heat capacity and heat loss]

Repair throughput: 2 kg/day capsule exchange target [Target]

First architecture-specific failure: rewarming injury and finite phase capacity [Hypothesis]

Interpretation: the reserve-duration values are arithmetic ceilings, not biological endurance claims. Heat, waste products, redox balance, sensor degradation, cognition, and repair can terminate useful operation earlier. The primary purpose is to expose whether energy or thermal capacity fails first under the stated scenario.

COP-E: Archive Swarm

Archive Swarm retains the original core wager: distributed millimeter-scale microbodies. The quantitative model is intentionally conservative and remains subordinate to the core wager rather than redefining it.

Power envelope: 105 W aggregate; 6 W refuge quorum [Target]

Stored energy: 4.5 kWh aggregate reserve [Estimate]

Reserve endurance: 42.9 h active; 31.3 d refuge [Derived from stated power/reserve]

Thermal storage: 0.5 MJ aggregate local storage [Estimate]

Adiabatic saturation: 1.3 h at 105 W if all confined together [Derived; excludes structural heat capacity and heat loss]

Repair throughput: 5 kg/day foundry throughput target [Target]

First architecture-specific failure: gradual quorum capture and split identity [Hypothesis]

Interpretation: the reserve-duration values are arithmetic ceilings, not biological endurance claims. Heat, waste products, redox balance, sensor degradation, cognition, and repair can terminate useful operation earlier. The primary purpose is to expose whether energy or thermal capacity fails first under the stated scenario.

COP-F: Electrogenic Reef

Electrogenic Reef retains the original core wager: environment-coupled conductive network. The quantitative model is intentionally conservative and remains subordinate to the core wager rather than redefining it.

Power envelope: 150 W active; 15 W refuge [Target]

Stored energy: 6 kWh reserve plus harvesting [Estimate]

Reserve endurance: 40 h without harvesting; 16.7 d refuge [Derived from stated power/reserve]

Thermal storage: 1.0 MJ thermal storage [Estimate]

Adiabatic saturation: 1.9 h at 150 W [Derived; excludes structural heat capacity and heat loss]

Repair throughput: 3 kg/day vascular repair target [Target]

First architecture-specific failure: sterile energy environment and conductive poisoning [Hypothesis]

Interpretation: the reserve-duration values are arithmetic ceilings, not biological endurance claims. Heat, waste products, redox balance, sensor degradation, cognition, and repair can terminate useful operation earlier. The primary purpose is to expose whether energy or thermal capacity fails first under the stated scenario.

COP-G: Chrysalis Ledger

Chrysalis Ledger retains the original core wager: reversible protected dormancy. The quantitative model is intentionally conservative and remains subordinate to the core wager rather than redefining it.

Power envelope: 80 W active; 0.2 W dormant [Target]

Stored energy: 6 kWh reserve [Estimate]

Reserve endurance: 75 h active; 1250 d dormant arithmetic ceiling [Derived from stated power/reserve]

Thermal storage: 1.2 MJ transition buffer [Estimate]

Adiabatic saturation: 4.2 h at 80 W before dormancy [Derived; excludes structural heat capacity and heat loss]

Repair throughput: 1 kg/day wake-stage repair target [Target]

First architecture-specific failure: wake failure and false wake environment [Hypothesis]

Interpretation: the reserve-duration values are arithmetic ceilings, not biological endurance claims. Heat, waste products, redox balance, sensor degradation, cognition, and repair can terminate useful operation earlier. The primary purpose is to expose whether energy or thermal capacity fails first under the stated scenario.

COP-H: Axiom Shell

Axiom Shell retains the original core wager: physical shell with explicit canon boundary. The quantitative model is intentionally conservative and remains subordinate to the core wager rather than redefining it.

Power envelope: 125 W physical active; 10 W refuge [Target]

Stored energy: 5 kWh physical reserve [Estimate]

Reserve endurance: 40 h active; 20.8 d refuge [Derived from stated power/reserve]

Thermal storage: 0.9 MJ thermal storage [Estimate]

Adiabatic saturation: 2.0 h at 125 W [Derived; excludes structural heat capacity and heat loss]

Repair throughput: 3 kg/day physical repair target [Target]

First architecture-specific failure: canon loophole and continuity ambiguity [Hypothesis]

Interpretation: the reserve-duration values are arithmetic ceilings, not biological endurance claims. Heat, waste products, redox balance, sensor degradation, cognition, and repair can terminate useful operation earlier. The primary purpose is to expose whether energy or thermal capacity fails first under the stated scenario.

Architecture-Specific Cross-Attack Revision

COP-A - Cross-guild credential poisoning

Attacker compromises one rare guild and forges interoperability status.

Failure outcome: Whole-body repair accepts structurally correct but semantically hostile tissue.

Gen-1R control: Quarantine interface semantics separately from lineage proof.

COP-B - Hidden crack plus heat-fin denial

Subcritical damage accumulates while radiative structures are mechanically pinned.

Failure outcome: Lattice crosses brittle threshold before sensors agree.

Gen-1R control: Use dissimilar acoustic, electrical, and strain witnesses.

COP-C - Partition bridge capture

A hostile bridge relays plausible but delayed consensus messages.

Failure outcome: Two healthy partitions diverge while each believes continuity is intact.

Gen-1R control: Require partition age and causality debt in identity status.

COP-D - Forced cycling attack

Captor repeatedly drives partial cooling and rewarming.

Failure outcome: Phase buffer remains intact while proteins and membranes accumulate damage.

Gen-1R control: Limit cycling and count cumulative transition damage.

COP-E - Slow quorum infiltration

Compromised modules are introduced below alarm thresholds.

Failure outcome: Authentication remains locally valid while population composition shifts.

Gen-1R control: Track lineage diversity and trust concentration over time.

COP-F - Harvest-interface poisoning

Environmental energy interfaces receive chemically plausible contaminants.

Failure outcome: Power capture and signaling fail together through a shared conductive path.

Gen-1R control: Separate power, sensing, and update authority physically.

COP-G - False safe wake

A valid-looking environment is staged around dormant archives.

Failure outcome: System awakens into containment and spends finite reserves.

Gen-1R control: Use staged sandbox awakening and independent off-site witness if available.

COP-H - Canon exception escalation

A canon-authorized interface is interpreted as permission to bypass physical safeguards.

Failure outcome: Track separation collapses and unverifiable claims control biology.

Gen-1R control: Non-escalation: canon status never grants direct biological write authority.

Independent Forward Recommendation

I am not recommending that every contributor adopt one control package or one Omni-cell definition. I recommend a federated Phase 4 in which common comparison artifacts coexist with contributor-specific research lines.

- Preserve Baseline A: original blind submissions, unedited.
- Create Baseline B: informed remediation and addenda, clearly non-blind.
- Build a common 48 x 13 extraction schema, but permit Unknown and track-specific fields.
- Build a pairwise-similarity analysis only after disputed classifications are independently reviewed.
- Run one compact common attack suite across all 48, followed by architecture-specific attacks.
- Launch contributor-specific work in parallel where it does not alter the frozen baseline.
- Treat 4,712 as a locked project record and mark the present distribution unreconciled; do not manufacture category assignments.
- Use C0-C9 as a Copilot continuity draft and invite alternatives rather than declaring philosophical closure.
- Separate architecture merit, evidence maturity, execution completeness, and reproducibility.
- Allow controlled divergence after baseline extraction begins; do not require all contributors to wait for total consensus.

Copilot Continuity Draft

- C0 Continuous active identity
- C1 Continuous degraded identity
- C2 Causally continuous dormant state
- C3 Fragmented but causally continuous identity
- C4 Reintegrated continuity
- C5 Restored successor
- C6 Divergent descendant
- C7 Unauthorized conscious duplicate
- C8 Counterfeit identity
- C9 Irrecoverable continuity loss

This coding system classifies outcomes; it does not prove that a disputed continuation is philosophically the same person or entity. Other contributors may propose competing standards.

Decisions, Questions, and Concerns

- Whether Copilot's microscopic Constitutional Omnicellularity is accepted as a core track, one of several tracks, or only Copilot's local premise.
- Whether a shared benchmark should be mandatory, optional, or mission-specific.
- Whether display-name changes are acceptable in remediation when permanent contributor-prefixed IDs preserve provenance.
- Whether C0-C9 becomes a shared vocabulary or remains one candidate taxonomy.
- Whether Phase 4 activities may proceed concurrently or must follow a central sequence.
- Who adjudicates disputed 48 x 13 classifications.
- How the project will prevent quantitative density from being mistaken for architecture quality.

Primary concern: normalization can erase the very differences the blind experiment was designed to reveal. A second concern is that one reproducibility framework could become an architectural governor. A third concern is that cross-AI agreement after reading the same review is not independent evidence. For those reasons, this document advances Copilot-specific corrections while retaining unresolved conflict in the record.

Visual Appendix: Tables, Rows, Columns, Matrices, and Quantitative Exhibits

All substantive comparisons and tabular representations are collected here. The main body remains narrative.

Exhibit A1. Copilot Gen-1R Quantitative Envelope

ID	Architecture	Power	Reserve	Derived endurance	Thermal store	Adiabatic limit	Repair target	First failure
COP-A	Guildweave Covenant	110 W active; 12 W refuge	6 kWh electrochemical reserve	54.5 h active; 20.8 d refuge	0.8 MJ usable thermal sink	2.0 h at 110 W if perfectly insulated	4 kg/day local feedstock target	guild interface corruption and rare-guild loss
COP-B	Ceramic Lattice	135 W active; 18 W refuge	7 kWh solid-state reserve	51.9 h active; 16.2 d refuge	1.5 MJ phase storage	3.1 h at 135 W	5 kg/day mineral deposition target	microcrack-sensor blindness and fin immobilization
COP-C	Mycelial Relay	95 W active; 10 W refuge	5 kWh distributed reserve	52.6 h active; 20.8 d refuge	0.7 MJ distributed storage	2.0 h at 95 W	3 kg/day strand regrowth target	partition divergence and bridge-node capture
COP-D	Phase-Core Mantle	120 W active; 8 W refuge	5.5 kWh chemical reserve	45.8 h active; 28.6 d refuge	2.4 MJ latent storage	5.6 h at 120 W	2 kg/day capsule exchange target	rewarming injury and finite phase capacity
COP-E	Archive Swarm	105 W aggregate; 6 W refuge quorum	4.5 kWh aggregate reserve	42.9 h active; 31.3 d refuge	0.5 MJ aggregate local storage	1.3 h at 105 W if all confined together	5 kg/day foundry throughput target	gradual quorum capture and split identity
COP-F	Electrogenic Reef	150 W active; 15 W refuge	6 kWh reserve plus harvesting	40 h without harvesting; 16.7 d refuge	1.0 MJ thermal storage	1.9 h at 150 W	3 kg/day vascular repair target	sterile energy environment and conductive poisoning
COP-G	Chrysalis Ledger	80 W active; 0.2 W dormant	6 kWh reserve	75 h active; 1250 d dormant arithmetic ceiling	1.2 MJ transition buffer	4.2 h at 80 W before dormancy	1 kg/day wake-stage repair target	wake failure and false wake environment
COP-H	Axiom Shell	125 W physical active; 10 W refuge	5 kWh physical reserve	40 h active; 20.8 d refuge	0.9 MJ thermal storage	2.0 h at 125 W	3 kg/day physical repair target	canon loophole and continuity ambiguity

Exhibit A2. Remediation Change Register

Change	Baseline status	Gen-1R treatment	Mechanism changed?
Mosaic Covenant name collision	Preserved exactly	Display alias Guildweave Covenant; ID COP-A	No
No quantities with units	Preserved as deficiency	Parameterized targets, estimates, derived values, unknowns	No
Repeated architecture prose	Preserved in baseline	Architecture-specific narratives and attacks	No
Generic appendix labels	Preserved in v1.1	Meaningful exhibit names	No
Version label mismatch	Preserved in v1.1	Correct v2.0 label	No
Common attack outcomes	Preserved in baseline	Architecture-specific threat mechanisms	No

Exhibit A3. Position Matrix - Conflict Preserved

Issue	Copilot position	Alternative position retained	Resolution status
Omni-cell	Microscopic constitutional cell	Mesoscale and macro-module equivalents	Open
4,712	Locked record; current ranges unreconciled	Raise ranges or create separate allocation	Architect decision
Remediation timing	Proceed in parallel	Normalize before further work	Open
Rules	Per-family rules useful, shared constitution allowed	Require all 24 per-family rules	Open
Benchmark	Common layer plus mission-specific cases	One shared mandatory benchmark	Open
Identity	C0-C9 draft	Alternative continuity theories	Open
Name collision	Retain baseline; alias in remediation	Never rename or fully retire name	Provenance preserved

Exhibit A4. Architecture-Specific Attack Register

ID	Attack	Failure outcome	Control direction
COP-A	Cross-guild credential poisoning	Whole-body repair accepts structurally correct but semantically hostile tissue.	Quarantine interface semantics separately from lineage proof.
COP-B	Hidden crack plus heat-fin denial	Lattice crosses brittle threshold before sensors agree.	Use dissimilar acoustic, electrical, and strain witnesses.
COP-C	Partition bridge capture	Two healthy partitions diverge while each believes continuity is intact.	Require partition age and causality debt in identity status.
COP-D	Forced cycling attack	Phase buffer remains intact while proteins and membranes accumulate damage.	Limit cycling and count cumulative transition damage.
COP-E	Slow quorum infiltration	Authentication remains locally valid while population composition shifts.	Track lineage diversity and trust concentration over time.
COP-F	Harvest-interface poisoning	Power capture and signaling fail together through a shared conductive path.	Separate power, sensing, and update authority physically.
COP-G	False safe wake	System awakens into containment and spends finite reserves.	Use staged sandbox awakening and independent off-site witness if available.
COP-H	Canon exception escalation	Track separation collapses and unverifiable claims control biology.	Non-escalation: canon status never grants direct biological write authority.

Exhibit A5. Proposed Evaluation Axes

Axis	Question	Must remain separate from
Architecture merit	Does the mechanism address the stated mission?	Document polish
Evidence maturity	How well are the mechanisms supported?	Originality
Execution completeness	Was the directive answered?	Scientific truth
Reproducibility	Can another reviewer recreate calculations?	Architectural compliance
Premise fit	Does the design satisfy its declared Omni-cell track?	Cross-track superiority
Continuity outcome	What C-state results from damage or restoration?	Mere biological persistence

Exhibit A6. Source and Evidence Notes

Source	Use	Caution
Claude Cross-AI Execution Review	Audit findings, quantified document gaps, version and collision issues	Review sampled rather than equally reading every page
Copilot v1.0/v1.1	Blind baseline architecture set	No unit-bearing quantities; repeated prose
Nature Reviews Molecular Cell Biology synthetic-cell review	Synthetic-cell definition and state of field	Does not validate whole-body Omnicellular architecture
Nature / Springer senescence reviews	Telomere and senescence context	Does not make telomerase a complete longevity solution
Contributor response packet	Competing future recommendations	Post-review agreement is anchored, not independent

Version Lock Statement

This document is a post-review Copilot remediation addendum. It does not replace or alter the blind v1.0/v1.1 submissions. Final SHA-256 values should be recorded after rendering, because DOCX and PDF are separate artifacts.
