OAL Currency Laboratory

Experimental Coordination Sheet and Pilot Configuration v0.1

Independent Contribution by Grok

Status: PROPOSED / Pre-Canon. Not an owner-adopted run configuration. Not canon.

Date: 7 November 2026 | Directive: OAL-CURR-NEXT-001

Purpose: Provide a minimal coordination layer so independent reviewers can execute the same first pilot without hidden premise drift, while preserving all original contributor documents and architectural forks.

1. Executive Assessment and Recommended Next Action

The laboratory is ready for controlled pilot testing once a named run configuration is explicitly adopted by the project owner. No further full charter rewrite is required as a prerequisite. The highest-value next artifact is a short coordination sheet that freezes one pilot, establishes namespaced identifiers, and clarifies that existing rules remain PROPOSED until adoption.

This document is that coordination sheet. It does not select winning currency mechanics. It does not reconcile the six independent packages into one architecture. It creates a common experimental interface for the first discriminating test.

2. Status Vocabulary (Governing This Sheet)

Until the project owner adopts a named run configuration, every rule in the existing packages and in this sheet remains PROPOSED. Adoption is a separate act from requesting a document.

• **PROPOSED** — Available for criticism; not adopted for any run.

• **OWNER-ADOPTED** — Accepted by Nathan for an explicitly stated scope and named run.

• **LOCKED FOR TESTING** — Frozen revision used only for specified runs after owner adoption.

• **EXPERIMENTALLY SUPPORTED** — A particular claim has supporting results within a stated scope and evidence level.

• **CONSTITUTIONALLY ADOPTED / CANON** — Explicit owner acceptance into the architecture. Currently none.

3. Namespaced Test-ID Registry (Pilot Scope)

Original contributor identifiers are preserved. For cross-document comparison, use the qualified form: contributor/document-revision/original-id.

Qualified ID	Contributor	Original ID	Title
perplexity/charter-v0.1/F01	Perplexity	F01	Resource-box discriminator
perplexity/charter-v0.1/F03	Perplexity	F03	Undefined vs incoherent
grok/coord-v0.1/PILOT-001	Grok	PILOT-001	Frozen resource-box pilot

4. Frozen Pilot Configuration: OAL-QC-PILOT-001

Pilot name: Resource-Box Capability Discriminator (based on Perplexity F01, with explicit capability labeling).

Status: PROPOSED until Nathan adopts this named run card.

4.1 Fixture (Closed Synthetic Environment)

• Party A starts with 10 identifiable fungible resource units.

• Party B starts with 0 resource units.

• Requested outcome: B receives 3 units that satisfy the fixture usability criterion.

• No third-party resource pool unless explicitly declared in a configuration.

• Authorization for ordinary transfer is granted in the baseline transfer configuration.

• No fees, losses, or external consequences in the baseline fixture.

• Synthetic valuation convention for this pilot only: one-to-one resource equivalence. Not a permanent QC rule.

4.2 Competing Capability Configurations

Each configuration is a separate assumed system. Differences are consequences of the stipulated capability, not independent discoveries.

Config	Stipulated Capability	Observation Required
P0-Eval	Return typed value description only	Value output; no resource movement
P1-Transfer	Move existing authorized units from A to B	A=7, B=3, total=10; conservation within boundary
P2-Create	Instantiate 3 new units under declared creation primitive	A=10, B=3, total=13; new identities if observable
P3-Enact	Establish specified target state directly	Exact state change; declare any other accounting effects

5. Reporting Requirements and Evidence Distinctions

Every independent run must record: assumed capability (explicitly labeled); conditional analytical deduction under those assumptions; any actually executed simulation or code result; whether the requested outcome was satisfied; internal consistency under the declared rules; and any underspecification or observational indistinguishability.

Two separate verdicts are required: Verdict A — Internal consistency under declared assumptions. Verdict B — Satisfaction of the requested outcome. An evaluation-only model may pass A while failing B; that is not automatically a contradiction.

6. Rules for Independent Runs

• Collect first-pass responses before circulating peer results where practical.

• Record prior exposure to other packages honestly.

• Do not pre-write success or NCOIN generation into acceptance criteria.

• Do not treat a stipulated capability as independently demonstrated evidence.

• Preserve original contributor documents; this sheet does not replace them.

• An informative result includes specification gaps, indistinguishability, or differential behavior.

7. Owner Decisions Required

• Adopt or amend this pilot run card (OAL-QC-PILOT-001).

• Confirm whether “mechanically redundant but narratively retained” is an allowed instrument outcome.

• Authorize the first independent run cycle.

8. Recommended Immediate Artifacts

• This Coordination Sheet v0.1 (DOCX + PDF).

• Owner adoption record (if adopted).

• Independent first-pass run records from team members.

• Challenge responses after first-pass collection.

9. Final Recommendation

Authorize a limited analytical pilot on the Resource-Box Discriminator under the four capability configurations above. Do not ratify any disputed currency mechanism. After independent traces and a challenge round, revise only the rules the pilot actually exposes as ambiguous. This produces new differential evidence while preserving architectural disagreements and the original QC premise.

End of Experimental Coordination Sheet v0.1 — Prepared independently by Grok for the OAL AI Collaboration Team.
