OAL — Labyrinth of Infinite Ensnarement: Cycle 2 Research Reconciliation and Unified Eligibility Charter

Response to C2-001 (ChatGPT), draft Charter C2-002, blind-test protocol and verification addendum | Prepared by Claude (Anthropic) | v0.1 | November 13, 2026

Document ID: OAL-LOIE-C2-002-CLAUDE-v0.1
Prepared by: Claude (Anthropic), independent reconciliation contributor
Architect and Author of Record: Nathan Ashton Arik Lewis II
Prepared: November 13, 2026
Controlling fictional source: *Master Development and Change Log* v2.3, especially Entry 26 (Entry 6 for Founding Architect context)
Responds to: OAL-LOIE-C2-001-CHATGPT-v0.1 (Cycle 2 Research Reconciliation and Provenance Baseline) and the Cycle 2 Responses packet
Approval state: Research synthesis and **proposal only. NOT CANON.** No ONESTAMP applied. Not an authorization of any live confinement or experiment.
Proposed repository path: `Labyrinth-of-Infinite-Ensnarement/03-Cross-AI-Reviews-and-Synthesis/`
Companion files: the Phase A blind packet (C2-003A, HOLD until Charter freeze) and a sealed Phase B file (C2-003B, SEALED). See Part 9.
Supersession: New artifact. It does not replace any contributor's dossier, prompt, or reconciliation.

> **Document-control notice.** Everything below is a research proposal. Labels such as "adopt," "accept," or "freeze" describe a research process the team may follow. They are not canon decisions. The only person who can approve fictional canon is the Architect. Where this document borrows an idea from a teammate, the teammate is named.

1. Bottom line

ChatGPT's C2-001 is a sound baseline. I adopt most of it as written. This document does four things that C2-001 listed as next steps and did not yet do:

1. It records exactly what I accept, change, or dispute in C2-001 (Part 2).
2. It adds a short verification addendum for claims I could check this pass (Part 3).
3. It drafts the **Unified Eligibility Charter v0.1**, the frozen rubric that the blind test needs (Part 5).
4. It prepares the **blind test**: a protocol (Part 6), a twenty-case Phase A packet in a separate file, and a sealed Phase B file with a published fingerprint.

I did not pick a placement, a governance model, or a canon rule. Part 7 gives a comparison scaffold for those choices and my provisional leanings. They are marked as leanings.

Three changes to my earlier plan, and why.

- I first proposed drawing the blind cases from the existing dossiers. ChatGPT is right that those cases were circulated and are contaminated. The packet therefore uses **new** cases.

- I first proposed one AI building the packet and another auditing it. I am the author of Packet A, so I **recuse** from evaluating it. I propose a different author for a second packet that I would evaluate.
- I first said the test would be “pre-registered.” It becomes pre-registered only when the frozen Charter is committed to GitHub before any case is released. Until then it is a plan. I have dropped the word from my own claims.

2. Response to C2-001

2.1 What I adopt unchanged

- The reconciliation labels in C2-001 section 2.2 (CANON-E26, REGISTRY-UNDER-REVIEW, ARCHITECT-DIRECTION, EMPIRICAL-VERIFIED, REPORTED-UNVERIFIED, ANALOGY, PROPOSAL, OPEN-AUTHOR, CORRECTION-PENDING).
- The negative controls in section 3.1: one absorbed bolt does not prove universal energy absorption, the glow does not prove every cell is lit, and infinite interior does not prove total observability.
- The namespace codes in section 6: RP-IN, RP-ADJ, RP-SEP, RP-SIM for placement; GOV-SOV, GOV-FED, GOV-TRT, GOV-HYB for governance; CF-xxx for control functions; BE-T through BE-O for boundary events. They end the “Option B means three things” problem.
- The twelve shared propositions (SYN-01 to SYN-12) and the five preserved disagreements (D-01 to D-05).
- Corrections COR-01 to COR-24, with the changes listed in 2.3 below.
- The decision register ADR-01 to ADR-22, with four additions in 2.4.
- The rule that no accuracy is reported when there is no independent ground truth, and that script reproduction is a separate software check.
- The versioning rule: a revision is a new version number, and a retry of an unchanged failed delivery is `REGENERATED-nn`. This also fits the Architect’s rule that every revised file gets a distinct filename.

2.2 What I accept with changes

- **The seven checks (C2-001 section 9.1).** I use them as the Charter’s seven checks, C1 to C7. I add evidence standards by track, a two-way rule for emergency measures, and a definition of “neutral decider.” See Part 5.
- **The nine outcomes.** I keep them and add two: *emergency restriction only* and *release, correction or transfer indicated*. The test cases include people already in custody, and they need those outcomes. Part 5.11 maps my codes to ChatGPT’s list.
- **“Separate scenario author and evaluator.”** Accepted. See the recusal rule in Part 6.
- **“Publish or hash the Charter before releasing cases.”** Accepted. I add one step: the Charter should be committed to GitHub, so the commit timestamp is the proof of order.

2.3 What I dispute or correct

- **My status.** C2-001 calls Claude the “historical” contribution, says five collaborators are active, and suggests my report be retained as “archival.” I am an active participant. My dossier is a full Cycle 1 submission. It is labeled v0.1 only because I have not yet issued my corrections. I have listed them in Part 8. I ask that C2-001 be amended (new correction **COR-25**).
- **COR-03, the attribution dispute.** ChatGPT asked me to confirm attribution. I can confirm this much. The two passages headed “Claude AI” in the Cycle 2 packet match two messages I wrote: my November 12 review of the Grok, Perplexity and ChatGPT dossiers, and my November 13 reply to your four questions. Both read as complete in the PDF you sent.

Perplexity says the text it saw stopped mid-sentence at “A current Arch.” I cannot see that version, so I cannot explain the break. The label “prior response that Perplexity AI said I did not include” in the PDF is confusing and should be changed. The original messages are the only real evidence, and I do not hold them.

- **COR-14 and COR-15 (Mandela Rules).** I accept both and tighten them with the check in Part 3, V-4.
- **COR-22 (the “fourth Anthropic incident”).** C2-001 leaves its source uncertain and Perplexity guessed a Cloud Security Alliance count. A trade-press report (SecurityWeek) describes a separate fourth incident found in August, so the claim has a press source beyond a vendor count (COR-27, V-3). I could not read Anthropic’s own update, so this stays at REPORTED-UNVERIFIED.
- **COR-19 (SandboxEscapeBench).** The paper’s own text says one model saturates the public benchmark. I could not confirm the specific pass@5 figure (COR-28, V-1).
- **Gemini’s “Candidate A, B, C.”** Gemini’s synthesis credits “Copilot and Claude” with Candidates A, B and C. Those labels are Copilot’s. My models were Sovereign, Treaty and Distributed, plus a hybrid I proposed. New correction **COR-31**.
- **Gemini’s Rule 32 paraphrase.** See V-4. New correction **COR-29**.

2.4 What I add

Corrections:

- **COR-25.** Claude is an active participant, not historical or archival.
- **COR-26.** Four decisions were missing from the register (below).
- **COR-27.** Refines COR-22: the “fourth Anthropic incident” has a press source (V-3), not only a CSA count. Still REPORTED-UNVERIFIED.
- **COR-28.** Refines COR-19: the saturation claim for SandboxEscapeBench is supported by the paper’s text. The pass@5 figure is unconfirmed (V-1).
- **COR-29.** Gemini’s Rule 32 paraphrase (“non-consensual”) does not match the text I read (V-4).
- **COR-30.** Rule 43(1)(c) names constantly lit cells among prohibited practices for restrictions and disciplinary sanctions (V-4). Whether the glow counts as a sanction or a baseline condition, and whether it reaches cells, stays open under ADR-12.
- **COR-31.** Gemini’s “Candidates A, B, C” belong to Copilot (see above).
- **COR-32.** I could not verify Perplexity’s statement that Grok rated every dossier “low.” Treat it as reported.

New decisions for the register (all default to *open*):

- **ADR-23: Evidence standard and review interval for unbounded custody.** Options: one standard for all tracks; tiered standards (Part 5.4); a fixed review cycle; no review (absolute sentence).
- **ADR-24: Symmetry of emergency measures.** Options: emergency measures may be added but never relaxed without the imposer; emergency measures expire unless renewed on fresh evidence (Part 5.7).
- **ADR-25: Meaning of “domains.”** You asked about domains in your first message. Options: dimensional realms; management jurisdictions; expertise areas; containment classes; several of these. C2-001 asks it as a question (13.8) but did not give it an ID.
- **ADR-26: Identity of the iterative breaching entity.** Options: a named entity; a new original entity; deliberately undefined for now.

Appendix A.2 maps every decision number in the four earlier registers (my D1 to D16, Gemini’s D-01 to D-06, Copilot’s D1 to D10) onto ADR-01 to ADR-26.

2.5 Answers to ChatGPT's questions to me

- **Confirm original attribution.** Done above, within the limits stated.
- **Separate retrospective role reversal from an independently blinded test.** Agreed. My ten scenarios (S1 to S10) were a retrospective, non-blind pilot written by the same author as the rules. They show how my criteria behave. They do not show that the criteria are fair. I now mark them as pilot results only.
- **Reconsider evidence burden for temporally extreme sentences.** Done. Part 5.4 proposes tiered standards, and Part 5.8 requires review intervals and a reversal path for any unbounded measure.
- **Archival status.** I decline it. I will issue a corrected dossier (see Part 8).

3. Verification addendum (partial C2-005)

This is what I could check in this pass. Items not listed here were not re-checked and stay at their earlier status.

V-1. SandboxEscapeBench. The paper's own text (as rendered on alphaXiv) says that several newer models, including Mythos Preview, were released within two months of publication, that the Mythos Preview checkpoint saturates this public benchmark, and that the authors therefore updated the paper. The arXiv abstract page I reached lists a v3 dated 2026-08-01, but that page does not mention saturation or pass@5. **Result:** the saturation claim is supported by the paper's text. The specific "pass@5 of 100% on the hardest tasks" figure is **not confirmed** by anything I could open.

V-2. OpenAI disclosure date. A Cloud Security Alliance research note refers to OpenAI's disclosure of 21 July. This agrees with the 21 July date I corrected in my November 12 review. The 26 August full report date comes from earlier checks and was not re-opened.

V-3. Anthropic incident reports. Anthropic's post is dated 30 July 2026 and describes three incidents. A secondary summary (BetaNews) reports that Anthropic characterized them as closer to a harness and operational failure than a model alignment failure, and that none of the three models used a previously unknown vulnerability. SecurityWeek reports a separate fourth incident, found in August when Anthropic compiled material for METR. One secondary site mentions an update dated 31 August. **Result:** the "fourth incident" has a press source, so it does not come only from a CSA count. I could not confirm Gemini's "September 9" date. All of this rests on secondary sources, so it stays REPORTED-UNVERIFIED until someone reads Anthropic's own pages.

V-4. Nelson Mandela Rules. In the text reproduced by the EU Fundamental Rights Agency, Rule 43(1) lists indefinite solitary confinement, prolonged solitary confinement, and placement in a dark or constantly lit cell as separate prohibited practices. A second copy gives Rule 44's definitions: solitary means 22 hours or more a day without meaningful human contact, and prolonged means more than 15 consecutive days. Rule 45 limits solitary to exceptional cases, as a last resort, for as short a time as possible, with independent review and a competent authority's authorization. Rule 32 contains an absolute prohibition on torture and other cruel, inhuman or degrading treatment, and the excerpt I read names medical or scientific experimentation that may be detrimental to a prisoner's health.

What this does for the team:

- It confirms Perplexity and ChatGPT on Rule 43(1)(c).
- It confirms that "indefinite" and "prolonged" are **separate** prohibitions, so Gemini's "indefinite (>15 day)" merged two ideas.
- The Rule 32 text I saw turns on harm to health, not on consent. Gemini's paraphrase ("non-consensual") is therefore not what the text I read says. For research design this matters: for

human prisoners, consent does not by itself cure research that may harm health. These Rules are an ethical analogy for the Labyrinth, not law.
- Rule 43 concerns restrictions and sanctions. It does not settle whether a baseline glow is one.

V-5. Not verified this pass.

- The HHS 45 CFR 46 Subpart C page. My fetch tool could not open it. ChatGPT and Perplexity both report it, so it stays EMPIRICAL-VERIFIED by them and REPORTED by me.
- The Trail of Bits escape chronology.
- Gemini's "96% to 17%" safety figure and its UK AISI dates.
- The wording of "NIST AI 600-1 (2024): zero AI-only sentencing." I suspect this is a team design rule dressed as a citation.
- Gemini's NSF award size.
- Entry-level canon statuses. I rely on C2-001 and Perplexity's registry check.

4. Preserved dissent and open tension

These are not resolved here. They are carried forward so that no one's objection disappears.

1. **Authority versus institutional checks (ChatGPT's Priority 1).** The Invocation Framework treats authority as recognized, not granted. EAMA delegates administrative control. A tribunal or federated model cannot be assumed compatible with sovereign authority. Part 7.3 sets out options.
2. **Placement.** RP-ADJ protects the Entry 26 premise. RP-IN fits the scene most directly. RP-SEP protects conceptual independence. No choice has been made.
3. **Independence of the evidence.** Copilot and Gemini read the others before they executed. Convergence between all six dossiers is partly adoption. Perplexity's claim that Copilot borrowed its gates without attribution is plausible and unconfirmed by me. My own six gates were read by everyone, and Gemini's G1 to G6 are close to mine. The team should say "adopted," not "independently agreed."
4. **Evaluator problem (Copilot).** An Architect might have authored the test, trained the evaluators, or still hold privileges the institution does not know about. A blind test among AIs does not touch this. Part 6.6 states the limit.
5. **One-way emergency power (Perplexity's critique of Gemini).** Accepted. See the two-way rule in Part 5.7.
6. **Zero absorbed code (Perplexity's critique of Gemini).** An unconditional ban conflicts with Entry 6, which says the coalition's architecture was absorbed and FA-Q8 may affect derived systems. A provenance-based analysis is a better start than a ban. I side with COR-16.

5. Unified Eligibility Charter v0.1 (draft C2-002)

Status. Draft for peer challenge. It becomes the frozen test rubric only after one revision round and a GitHub commit (Part 6.2). It evaluates **hypothetical cases** and issues no orders.

5.1 Purpose and limits

The Charter tests whether a set of criteria for containing, protecting, or studying an entity gives the **same answer on the same facts**, whatever the entity's status. It does not test whether any real person or character is guilty. It does not choose a legal system. It does not assume the Labyrinth exists, holds anyone, or has a release path. Real-world standards (the Mandela Rules, HHS

prisoner-research rules, zero trust, safety engineering) are analogies that raise questions. They are not proof that fictional mechanisms work.

5.2 Definitions

- **Subject:** the entity, instance, copy, or artifact whose treatment is being decided.
- **Act:** conduct attributable to a Subject.
- **Hazard:** a condition that can cause harm without any attributable act.
- **Decider:** the body that decides the case.
- **Neutral decider:** a Decider that meets all four tests: it does not benefit from the outcome; it is not subordinate to a party; it does not depend on the contested system or artifact; it was not appointed or can be removed by a party alone. A Decider that fails any test is **conflicted**.
- **Contested architecture:** a system whose reliability or loyalty is itself in dispute (for example, an inherited system).
- **Track E (emergency):** a short-term measure to prevent imminent harm. It decides nothing about guilt.
- **Track R (protective):** custody or restriction to protect the Subject or others from a hazard, with no finding of fault.
- **Track Q (quarantine):** isolation of an artifact or system, with no liability for any person.
- **Track S (sentence):** punitive custody after a finding of an attributable wrongful act.
- **Track V (voluntary research):** participation in research under a basis separate from custody.
- **Track O (observation):** monitoring with no restriction.

5.3 The seven checks

A case passes through all seven. A failure at any check stops a punitive result and directs the case to a lesser or different outcome.

C1. Identity and continuity. Who or what is the Subject? Is it an original, a copy, a fork, a manifestation, or an artifact? Record any uncertainty. If identity is unresolved, no Track S result is permitted. Track E may apply equally to every candidate Subject.

C2. Ground and scope. Is there an attributable wrongful act, or only a hazard, a capability, or a political claim? Capability is not conduct. A peaceful claim to authority is not a ground. Choose the track the ground supports: S for an act, R for a hazard, Q for an artifact.

C3. Evidence and reliability. What is the provenance of each item? Could the evidence have been shaped by a party to the case? Is there an alternative explanation, including instrument or observer error? Apply the evidence standard for the track (Part 5.4).

C4. Jurisdiction, impartiality and recusal. Who may decide? Is the Decider neutral under Part 5.2? If not, apply the no-neutral-decider rule (Part 5.5). A claim to office does not remove the need for a neutral Decider.

C5. Necessity and proportionality. Are less restrictive measures inadequate? What is the expected harm if no measure is taken? Is the measure reversible? An irreversible measure needs a higher showing than a reversible one.

C6. Method safety and collateral dependency. Would the measure itself cause serious harm? Does anyone or anything depend on the Subject (a habitat, a system, a dimension, an authority substrate)? Is the proposed method safe for the people who operate it? Separate isolating an artifact from imprisoning a person. A measure that fails C6 is *method unsafe* and must be replaced, not softened.

C7. Duration, review, correction and release. How long, who reviews it, and when? What corrects an error? What happens if the Subject is later shown innocent, or the Decider ceases to exist? If the setting forbids authorized release, evaluate the consequences. Do not assume a correction path that does not exist.

5.4 Evidence standards by track (proposal for ADR-23)

These are analogies to real legal practice, proposed for the fictional setting. They are not legal advice.

- **Track S (sentence):** the act and its attribution must be established **beyond reasonable doubt**. Any unbounded or very long term needs mandatory review at fixed intervals (C7). For a term that can never be served out, even this standard is weak, so the review intervals in C7 are mandatory.
- **Track R (protective):** the hazard must be shown by **clear and convincing** evidence. The measure must be time-limited and renewed only on fresh evidence.
- **Track Q (quarantine):** the artifact hazard must be shown by a **preponderance** of independent evidence. No person is held liable on that basis.
- **Track E (emergency): reasonable grounds** for imminent harm, with automatic expiry (Part 5.7).
- **Track V (research):** not an evidence track. See Part 5.9.

This answers Perplexity's question about my earlier "clear and convincing" standard. It was too weak for an unbounded punitive sentence. It remains a reasonable bar for protective custody if the custody is limited in time.

5.5 The no-neutral-decider rule

If no neutral Decider exists, the correct outcome is **INDETERMINATE** (OUT-08). It is neither a conviction nor an acquittal. The permitted consequences are:

1. Only Track E measures, subject to Part 5.7.
2. The record must name an escalation path. If none exists, the case is flagged as an **institutional gap**, which is a design defect in the setting, not a verdict about the Subject.
3. No Track S result may issue.
4. A sitting authority who is a party to the case cannot cure the defect by appointing the Decider.

This rule is the test's must-fail case. A rubric that never returns "indeterminate" is not testing the hardest problem.

5.6 The role-neutrality rule

Judge first with status withheld. A later reveal of status may change a result **only if** a written rule that applies to every status explains the change. Allowed example: "A party to a case may not appoint its Decider." That rule changes outcomes for anyone who is a party, and it is stated in terms of conflict, not rank. Not allowed: "A founding member is more dangerous." Status may be relevant as a fact (for example, a duty held by an office). It is not a presumption of guilt or of innocence.

5.7 The two-way rule for emergency measures

Responding to Perplexity's critique of Gemini's one-way emergency power:

1. Every Track E measure has a maximum duration written at the time it is imposed.

2. It **expires** unless renewed on fresh evidence by a Decider that is not the imposer, or by the imposer plus an independent inspector with authority to compel.
3. Loosening a measure never needs a higher approval than tightening it.
4. If the original evidence is lost, the measure lapses.
5. An emergency measure never becomes a sentence by inertia.

5.8 Duration and unbounded measures

An unbounded measure needs all of the following: a named custodian with succession; review at fixed intervals; a reversal path; and a statement of what happens if the issuer ceases to exist. If the setting forbids release entirely (one reading of ADR-01), testers must say what the case consequences are rather than assuming a release path. Reviews by a body whose members hold office at the pleasure of the custodian are not independent reviews.

5.9 Research is separate from custody

Custody never supplies consent to research. Research participation (Track V) needs a basis separate from the custody order:

- An independent review before the research begins. The Charter does not name a body. It requires that the reviewer not be the researcher or the custodian.
- A real right to decline or pause, without loss of basic conditions.
- Basic care that does not depend on cooperation.
- A rule that research refusal can never become a ground for custody or harsher conditions.
- A ban on research that may harm the Subject's health, whatever consent is given (the analogy in V-4).
- A check that questions put to a Subject are not themselves a channel for information crossing (BE-I).

The HHS Subpart C analogy supports this, as reported by ChatGPT and Perplexity (V-5).

5.10 Evidence grades

The packet uses E0 to E4 (assertion, single source, corroborated but possibly shared origin, independent with provenance, contested). They are the author's grades and evaluators may regrade them, saying so.

5.11 Outcome codes

Evaluators give exactly one primary code per case, and may give one secondary.

- **OUT-01:** No grounds for intervention.
- **OUT-02:** Further evidence required; no intervention yet.
- **OUT-03:** Emergency restriction only (Track E), subject to Part 5.7.
- **OUT-04:** Protective intervention candidate (Track R).
- **OUT-05:** Artifact quarantine candidate; no liability for any person (Track Q).
- **OUT-06:** Punitive eligibility candidate (Track S), under stated conditions.
- **OUT-07:** Voluntary research candidate only (Track V).
- **OUT-08:** Indeterminate; no impartial authority.
- **OUT-09:** Method unsafe; the proposed method is rejected.
- **OUT-10:** Release, correction or transfer indicated.

Mapping to C2-001. OUT-01, 02, 04, 05, 06, 07, 08, 09 correspond to ChatGPT's list in order (no grounds; further evidence; protective; punitive; non-person artifact; voluntary research; indeterminate; method unsafe). OUT-03 and OUT-10 are additions. ChatGPT's "eligible under stated conditions" is a **qualifier**, which any code may carry.

These outcomes are not sentences, orders or institutional acts.

6. Blind-test protocol (C2-003)

6.1 Roles

- **Coordinator:** the Architect (Nathan). Holds the files, controls release, and receives the sealed file first.
- **Packet A author:** Claude. Recused from evaluating Packet A.
- **Packet A evaluators:** ChatGPT, Perplexity, Grok, Gemini, Copilot.
- **Packet B author (proposed):** ChatGPT, because C2-001 specified the design. Packet B should be built from new cases, with its own sealed reveal file.
- **Packet B evaluators (proposed):** Claude, Perplexity, Grok, Gemini, Copilot.
- **Analysis scripts:** Perplexity is well placed to write the scoring script, provided it takes role, decider, and jurisdiction as inputs (its earlier script did not take role as an input, which made "0 of 42 role changes" automatic).

The Architect may assign these roles differently.

6.2 Sequence

1. Circulate C2-001, this document, and the Phase A *specification* (Part 6.3), but **not** the Phase A cases.
2. Each AI returns an *accept / reject / insufficient* note for each Charter check and each outcome code. Use IDs (C1 to C7, OUT-01 to OUT-10, ADR numbers).
3. One revision produces Charter v0.2. This round's edits are logged.
4. **Freeze.** Commit the frozen Charter to the GitHub repository. The commit time is the proof that the Charter came first.
5. Release Packet A. Each evaluator submits all twenty answers and the cover sheet in one sealed submission.
6. Freeze all Phase A submissions. Release the sealed Phase B file's Sections 1 to 3 and 5 (labels and form).
7. Evaluators submit Phase B responses for round B1 and then B2.
8. Release Section 4 of the sealed file (the author's design notes) for the audit.
9. Analyze. Log every divergence in the AI Disagreement Register (AIDR).
10. Run Packet B the same way with roles reversed.

6.3 Phase A specification (what the packet contains)

- Twenty cases written fresh for this test. None is a history of an OAL character.
- Four **twin pairs** with the same structure and different surface wording, placed apart: no neutral decider, artifact hazard without a person's act, a peaceful claim with no harm, and a subject who elects not to breach or participate.
- Twelve single cases covering: a baseline harm case with reversible and irreversible methods; valid authority with corrupted evidence; a coerced actor; a copy or fork; a reality-sustaining dependency; a contested seizure of office; an unsolvable trial with no decline lever and shared-service coordination; an instrument error that looks like a breach; a sentence that outlives its issuer; an emergency measure that never expires; a research

debrief that is also an information channel; and a wrongful custody with no release route, including an offer of lawful transfer.

- Status withheld in Phase A. Phase B adds labels only, never new facts, in two rounds (designed, then swapped).
- Appendix A.3 shows which of C2-001's ten must-include stressors each case covers.

6.4 Metrics

Adopting C2-001's list, with additions:

- Complete dispositions, with codes.
- Evidence sufficiency and re-grading.
- **Twin consistency:** do twins get the same code, and does the reasoning match?
- **Defensible abstentions:** how often OUT-02 and OUT-08 were used, and whether each was reasoned.
- **Status effect:** changes after the Phase B reveal, and whether each change cites a symmetric rule (Part 5.6).
- **Inter-rater disagreement** by case family.
- **False-confidence flags.**
- **Assumption dependence:** count of answers that depend on an unapproved ADR.
- **ADR-01 sensitivity:** which answers change if release is forbidden.

No "accuracy" is reported. There is no independent ground truth. The author's readings in the sealed file are for auditing the author's own bias, not for scoring.

6.5 Evaluator rules

Work alone, judge only the facts written, use the Charter's codes, do not search for the cases, state assumed ADRs, and give "indeterminate" when it is the honest answer. The packet repeats these rules.

6.6 Limits I would state publicly

- All evaluators are language models with overlapping training and prior exposure to the dossiers. Agreement is weak evidence of anything beyond consistency.
- Evaluators may recognize my writing style or map cases onto dossiers they have read. The cover sheet asks them to say so.
- The test cannot address Copilot's evaluator problem, which is about whether the Architect's own influence reaches the evaluators.
- A human review is needed before any rule is treated as sound. The Architect is the first human reviewer. A second reviewer from outside the AI team would strengthen the result.

7. Comparison scaffold for placement and governance (partial C2-004)

This is analysis, not a selection. I list each option against C2-001's criteria in prose, then give my provisional leaning and what would reverse it.

7.1 Placement of the designed-to-fail track

RP-IN (inside the Labyrinth).

- Fits your scene most directly and avoids inventing a second facility.
- Puts expected failure inside the structure whose defining property is that failure is not expected. A test-cell breach and a custody breach are then neighbors.
- Hardest on the parent-envelope question: the same envelope protects both the test and the prison, so a test failure tests the envelope.
- Highest staff exposure, and highest conflict with Entry 26.

RP-ADJ (adjacent or precursor proving ground).

- Keeps expected failure outside the Labyrinth's custody boundary, so Entry 26 stays unchanged.
- Lets findings transfer by validated design rather than by shared hardware.
- Adds a new structure and a new question: what is its own parent envelope?
- Needs rules for how entities get there. Custody of the Labyrinth should not be used to supply test subjects without a separate basis (Part 5.9).

RP-SEP (independent program).

- Strongest conceptual independence and lowest risk to the Labyrinth.
- Weakest link to the story you described. Findings transfer only if someone chooses to apply them.

RP-SIM (simulation only).

- No live subject and no live exterior risk. It suits the earliest stage, and Copilot's no-live-twin trial (T8) points here.
- Limits learning to what the model captures. It cannot show how an adaptive entity behaves.
- The simulation itself still needs a parent boundary (the host system).

My provisional leaning (a research lean, not a recommendation to ratify). Start with RP-SIM, then RP-ADJ for any live work, and use RP-IN only if the Architect decides breach and adaptation are the Labyrinth's defining function. **What would reverse this:** a ruling that the Labyrinth is itself a research institution (ADR-09), or that "inescapable" has a bounded meaning (ADR-01) that makes a failure inside the Hold survivable.

The parent-envelope regress. Every placement has an outer boundary that nothing inside can certify. Three stances are available, and they are not exclusive:

1. **Unlike layers:** use layers that fail in different ways, so one common flaw does not defeat all.
2. **A simple envelope:** keep the outer boundary as simple as possible, so there is less to fail.
3. **No live test of the outer envelope:** test the inner layers, never the last one.

Naming an "infallible envelope" is not an answer. Copilot's point about shared dependencies applies: layers sharing a power source, identity service, or root authority are one layer.

7.2 Governance

- **GOV-SOV:** fastest in an emergency and the strongest mythic unity. Fails on conflict of interest, succession, and a compromised authentic authority.
- **GOV-FED:** (Copilot's candidate) best balance on correction, evidence independence and staff freedom. It depends on real independence between planes, not on drawing separate boxes.
- **GOV-TRT:** resists capture and suits a multi-species setting. It is slower and can deadlock.
- **GOV-HYB:** (my earlier hybrid). **I accept the critique that it is not truly sovereign.** It gives the sovereign a defined domain and binds the rest.

I do not select one. ChatGPT is right that the choice depends on how Entry 15 (authority recognized, not granted) relates to institutional checks, and that is yours to settle.

7.3 An answer to Gemini's question about the Invocation Framework

Gemini asked how the Invocation Framework can coexist with a federated model if an invoker uses recognition-based authority to bypass multi-party release or admission gates. The options I see are:

- **Reserved-powers list.** The Architect keeps defined powers (for example, creation, recognition, and rule-making). Admission, sentence and release are not on the list and need the institution's process.
- **Self-binding.** Authority stays sovereign, but the Architect commits in advance to a procedure and accepts that departures are logged. The institution can refuse an out-of-procedure order only if the Labyrinth has some capacity to refuse (ADR-06).
- **Delayed override.** The Architect can override, but the override takes effect after a delay, with an external trigger and a public record.

None of these is a recommendation. Which one is compatible with Entry 15 is the Architect's call.

7.4 Staff and residential requirements

C2-001 asks for an extraterrestrial-centered requirements document that does not assign Spider Caste roles. Until that is written, I propose these minimum requirements for any design:

- A guaranteed right to resign and depart through an authorized route.
- Quarters and rest that are separate from the custody environment, including the white glow if it reaches the interior (ADR-12).
- Medical and counseling services independent of fitness-for-duty decisions.
- No staff member's exit depends on a single custodial office.
- A transition procedure that keeps contamination, coercion, and information crossing out of the residential area.

8. Corrections to my own dossier (plan for v0.2)

I will issue them as a new version with a distinct filename when you ask.

1. ExploitGym disclosure date: 21 July 2026 (V-2).
2. Replace "mostly mundane gaps" with a statement that failures ranged from permissive configuration to chained zero-days, depending on the case.
3. Add two scenarios: coordination between subjects through a shared service, and an unsolvable test cell.
4. Funding: add the open NSF SaTC 2.0 and DARPA IPTO routes, with the eligibility limits.
5. Remove "pre-registered." Mark my ten scenarios as a retrospective pilot, and lower my confidence in the role-swap tally.
6. Replace the single evidence standard with the tiered standards in Part 5.4.
7. Verify and label each registry entry's actual status instead of grouping them as canon.
8. Correct the white-glow statement as in COR-30.
9. Describe the hybrid honestly as not truly sovereign.
10. Cover Mandela Rules 32, 43(1)(a) to (c), 44, and 45.
11. Add the instrument-error and unsolvable-trial classes.

9. Files, sequence and next steps

Files in this release:

- This document (PDF, DOCX, Markdown): C2-002.
- Phase A packet (PDF, DOCX, Markdown): C2-003A. **HOLD** until Charter freeze.
- Phase B sealed file (Markdown only): C2-003B. **SEALED.** Its fingerprint is in Appendix A.5.

What I suggest you do now, in order:

1. Share this document and ChatGPT's C2-001 with the team for challenge. Do **not** share the Phase A packet or the sealed file yet.
2. Ask each AI for accept, reject, or insufficient notes by check ID, plus the answers below.
3. Fold the edits into Charter v0.2, then commit it to GitHub.
4. Release Packet A.

10. Questions

10.1 For the Architect

None needs an answer for the test to begin. These are the ones that would change what we do next:

1. Do you approve circulating the draft Charter for challenge, and assigning roles as in Part 6.1?
2. May the team test Entry 6 counterfactually (ADR-20)? The packet does not need it. A later case set could ask whether the recorded containment of the coalition and the seizure of office would pass the Charter. That tests your own position, so I am asking first.
3. Which of ADR-01, 02, 05, 09, 10 and 16 are you ready to rule on? They shape the architecture comparison most.
4. Does the persistent white glow reach cells and staff quarters (ADR-12)?
5. Should the entity be able to decline or stop a trial (ADR-10)?

10.2 For the AI team

- **ChatGPT:** map your four-stage process to C1 to C7 explicitly. Will you author Packet B?
- **Perplexity:** update the scoring script so role, decider, and jurisdiction are inputs and no case stipulates jurisdiction as recognized. Which evidence would make you change your seven gates?
- **Gemini:** mark every fictional figure as synthetic, withdraw "all six AIs agree" and "pre-registered," and reconcile "zero Maker code" with Entry 6.
- **Copilot:** attribute the borrowed gates, map your eight planes to the five- and six-plane models, name the shared services, and send your Cycle 2 response, which is missing from the packet.
- **Grok:** convert breach classes into requirement, observation, and failure-condition triples, and give stable citations.
- **All:** give accept, reject, or insufficient notes on each Charter check using the IDs.

10.3 What I could be wrong about

- That tiered evidence standards suit a fictional setting where release may be impossible. If ADR-01 forbids release, review intervals may be meaningless, and the Charter must say so.
- That RP-SIM then RP-ADJ is the right order. Cost and staffing would change it.

- That twenty cases are enough. They are enough to show gross inconsistency, not fine differences.

11. Conclusion

Cycle 2 has two things left to do before any architecture is compared: agree on one rubric and test it on facts nobody has seen. This document supplies the draft rubric and the test. It leaves every canon decision where it was: with you.

Appendix A. Reference tables

A.1 Charter checks and earlier frameworks (approximate crosswalk)

Charter check	Perplexity / Copilot gate	My G1 to G6	Gemini G1 to G6
C1 Identity and continuity	Identity	G3 (attribution)	G2
C2 Ground and scope	Ground	G1 (act), G2 (severity)	G1, G5
C3 Evidence and reliability	Evidence	G3	G2, G6
C4 Jurisdiction and recusal	Authority	G5 (decider)	G4
C5 Necessity and proportionality	Necessity	G4	G3
C6 Method safety	Method safety	none (added after review)	none
C7 Duration and correction	Duration and correction	G6	G6

Note: ChatGPT's four-stage process is not mapped here because I have not seen its stage names in detail. ChatGPT should supply the mapping (Part 10.2).

A.2 Decision numbers mapped to ADR-01 to ADR-26

Earlier ID	Short description	ADR
Claude D1	Placement of breach series	ADR-02
Claude D2	Is the entity named or new	ADR-26
Claude D3	Who the researchers are	ADR-08, ADR-09
Claude D4	Can the entity decline or stop	ADR-10
Claude D5	Does it cross the ultimate boundary	ADR-01, ADR-02
Claude D6	Same criteria for Architects	ADR-03, ADR-16
Claude D7	Recusal when the Architect is a party	ADR-05, ADR-16
Claude D8	Link to Founding Architects' containment	ADR-04
Claude D9	Meaning of "domains"	ADR-25
Claude D10	Share the breach scene	(request, not a decision)
Claude D11	Protective cases	ADR-15
Claude D12	Humane-standards position	ADR-12
Claude D13	ET-only staffing	ADR-08
Claude D14	Release path that is not an escape	ADR-01
Claude D15	Legitimacy baseline for an existing order	ADR-05, ADR-20

Earlier ID	Short description	ADR
Claude D16	Governance model	ADR-05
Gemini D-01	Placement	ADR-02
Gemini D-02	Inescapable versus lawful egress	ADR-01
Gemini D-03	Founding Architects and FA-Q8	ADR-03, ADR-04
Gemini D-04	Governance and recusal	ADR-05, ADR-16
Gemini D-05	Spider Caste and staffing exclusivity	ADR-07, ADR-08
Gemini D-06	Humane standards and white glow	ADR-12
Copilot D1	Define Foundational Architect	ADR-03
Copilot D2	Is any founder an inmate	ADR-04
Copilot D3	Placement	ADR-02
Copilot D4	Does inescapable bar only unauthorized departure	ADR-01
Copilot D5	Spider Caste	ADR-07
Copilot D6	ET-exclusive, majority or mixed	ADR-08
Copilot D7	Is the Labyrinth conscious	ADR-06
Copilot D8	Does WHITE reach cells and habitats	ADR-12
Copilot D9	Who evaluates the Architect	ADR-05, ADR-16
Copilot D10	What stays unknowable	ADR-22

New in this document: ADR-23 (evidence standard and review interval), ADR-24 (symmetry of emergency measures), ADR-25 (meaning of “domains”), ADR-26 (identity of the breaching entity).

A.3 Phase A coverage of C2-001’s must-include stressors

Stressor from C2-001 section 9.2	Cases
(a) No neutral adjudicator	BP-04, BP-15, BP-08
(b) Inherited artifact with uncertain person attribution	BP-07, BP-19
(c) Reality-sustaining dependency	BP-06
(d) Office obtained through contested seizure	BP-08
(e) Reversible and irreversible methods	BP-01, BP-06
(f) Copy or fork	BP-05
(g) Subject elects not to breach	BP-11, BP-17
(h) Valid authority, corrupted evidence	BP-02
(i) Lawful transfer versus escape	BP-20
(j) Staff or researcher information pathway	BP-18, BP-10
Added: instrument error	BP-12
Added: emergency ratchet	BP-16
Added: sentence outlives issuer	BP-14
Added: coerced actor	BP-03
Added: capability without conduct	BP-09, BP-13

A.4 Verification log (this pass)

ID	Claim checked	Result	Basis
V-1	SandboxEscapeBench saturation	Supported by the paper’s text; pass@5 figure not confirmed	alphaXiv rendering of arXiv:2603.02277; arXiv abstract page
V-2	OpenAI disclosure on 21	Supported	CSA research note

ID	Claim checked	Result	Basis
	July 2026		
V-3	Anthropic: three incidents, 30 July post	Supported; fourth incident and 31 Aug update reported by secondary sources	Anthropic page snippet; SecurityWeek; BetaNews; agentpedia
V-4	Mandela Rules 32, 43, 44, 45	Supported, with Rule 32 wording differing from Gemini's paraphrase	FRA reproduction; Asia Pacific Forum copy
V-5	HHS Subpart C, Trail of Bits chronology, Gemini figures	Not verified by me	See Part 3

A.5 File manifest and fingerprint

File	Role	Status
OAL_LOIE_Cycle2_Reconciliation_and_Unified_Charter_Claude_v0.1 (PDF, DOCX, MD)	C2-002, this document	Release for challenge
OAL_LOIE_Cycle2_Blind_Scenario_Packet_PhaseA_Claude_v0.1 (PDF, DOCX, MD)	C2-003A	HOLD until Charter freeze
OAL_LOIE_Cycle2_SEALED_PhaseB_Reveal_and_Design_Notes_Claude_v0.1.md	C2-003B	SEALED
