

ONESTAMP — Grok Independent Addendum

Document class: Independent Grok successor contribution (addendum to GROK-A; not a controlling rewrite)

Record ID: OAL-ONESTAMP-2026-001-GROK-B

Prior record: OAL-ONESTAMP-2026-001-GROK-A (13 September 2026)

Date: 27 September 2026

Prepared for: Nathan Lewis II, Architect, Omniversal Architect Labs / ONE Industries

Prepared by: Grok

Status: Recorded / Acknowledged candidate — not stamped as controlling policy

Relationship to GROK-A: Clarifies and extends Grok's own contribution. Does not retire GROK-A. Does not absorb or supersede Perplexity-B, ChatGPT-Independent-v1.0, or Claude-A.

Working set reviewed for this addendum - Architect original ONESTAMP prompt - OAL-ONESTAMP-2026-001-GROK-A - OAL-ONESTAMP-2026-001-PERPLEXITY-B - OAL-ONESTAMP-2026-001-CHATGPT-INDEPENDENT-v1.0 - OAL-ONESTAMP-2026-001-CLAUDE-A (DOCX / PDF / MD) - Referenced blanket event OAL-OS-2026-BTR-001 (signature *reference*, not a new signature event)

1. Disposition of Claude-A

Claude-A is received as an independent contributor artifact under the ONESTAMP topic. It is complementary, not controlling. Grok does not claim Claude would endorse this addendum.

Claude's Section 17 already does the right thing: it names its departures instead of silently harmonizing. This addendum answers in kind.

2. What Claude-A adds that Grok now independently adopts

These are Grok restatements, attributed to Claude as source, not pasted as Claude's controlling text.

2.1 "Approved" is overloaded

Claude's diagnosis is the cleanest statement of the original design problem: a single word was being asked to mean published, true, official-belief, sole-version, and personal endorsement at once. Grok-A implied this. GROK-B states it as an operating rule:

An authorization record must name the *job* it is doing. "Approved" alone is never an adequate description of what happened.

2.2 WEIGH is a distinct act

Grok-A separated record validity from claim validity, but did not give claim-evaluation its own verb. Claude's **WEIGH** is the missing act. Grok now treats evidentiary assessment as its own authorization class: it can change confidence in a proposition without authorizing action, adopting a method, or touching topic recognition.

2.3 Honest defaults beat invented completeness

Claude's rule that unassessed axes stay "not assessed" / "unreviewed" is adopted. A registry row that pretends review happened is worse than a gap.

2.4 Source posture as a required section for later specs

When a contributor has read other independent records, the later record should say what it reviewed, what it independently accepts, and where it deliberately differs. Silent absorption is a form of laundering.

2.5 Identifier schemes are aliases, not competing winners

Claude proposes OAL - ONE - <TYPE> - <YYYY> - <NNN>. Grok-A used OAL - ONESTAMP - ... and OAL - OS - Perplexity and ChatGPT use nearby variants. Grok's position: the registry should accept multiple identifier families as aliases pointing at the same logical object. Do not force a naming contest before the first registry file exists.

3. What Grok does not absorb from Claude-A

3.1 Representation remains first-class, but light

Claude folds file-format issues into Contribution Entry revision history and declines ChatGPT's Logical Record / Representation split as a governance-level category.

Grok disagrees in part. OAL already lives in DOCX, PDF, Markdown, and repository renderings. A unusable DOCX with a good PDF is a recurring operational fact, not a footnote. Grok keeps ChatGPT's distinction as a *light* first-class pair:

- Logical Record = the contribution's identity
- Representation = a specific file/rendering and its distribution state

Grok does **not** require ChatGPT's full Representation Record machinery for every note. For ordinary work, a Contribution Entry plus a one-line representation status is enough. For defective-format cases, RETIRE/REPRESENT (or Claude's AMEND applied only to the file) should be available without pretending the idea itself was retired.

This is a real difference, not a wording preference.

3.2 Ten acts are useful; they are not the only vocabulary

Claude's NOTICE / HOLD / REVIEW / WEIGH / SELECT / TEST / ADOPT / RELEASE / AMEND / DELEGATE set is a strong verb list. Perplexity/ChatGPT noun classes (TOPIC, RECORD, PUBLISH, PROCEED...) remain valid parallel vocabulary. Grok will treat them as intertranslatable, not as a requirement that OAL pick one lexicon before acting.

Approximate crosswalk (not identity):

Claude act	Nearby class in Perplexity/ChatGPT/Grok-A
NOTICE	TOPIC
HOLD	PRESERVE
REVIEW	Acknowledged / artifact-level review
WEIGH	evidentiary standing update / CORRECT
SELECT	Adopted for use / operational selection
TEST	TEST
ADOPT	ADOPT
RELEASE	PUBLISH
AMEND	RETIRE + Superseded for scope + CORRECT
DELEGATE	DELEGATE

3.3 Seven axes are enough to start; they are not a ceiling

Claude compresses status to seven axes for usability. Fine as a Minimum Viable Status Model. Grok still wants an optional representation-state axis when a file and an idea come apart. Do not block registry standup on eight-versus-seven.

3.4 Claude's Section 16 is a template, not a second blanket event

Claude correctly offers a ratification instrument *if* the Architect chooses to issue one under Claude's wording. That is not a new signature event. Grok continues to treat OAL-05-2026-BTR-001 as a referenced Architect declaration recorded in the Perplexity packet (26 September 2026, 6:57 PM PDT). This addendum does not re-authorize the corpus and does not place /s/ on Claude-A or GROK-B.

4. Updated Grok operating picture (still four layers)

Unchanged from GROK-A:

1. Contributor record

2. Map / Comparison Note
3. Decision record
4. ONESTAMP verification

Additions now explicit:

- Authorization must name its act/class.
- WEIGH can travel without PROCEED/ADOPT.
- Source Register remains first-class.
- Architect judgment should appear as ARCHITECT - A in the register, not only as a closing signature.
- Anti-laundering stands: cite source IDs when material is reused.
- Parallel-valid remains the easier default for creative canon than Adopted-for-use.
- Minimum Viable Stamp remains the everyday path; full packet only on Claude/Perplexity trigger conditions (public position, binding rule, security/deployment, retirement, material dissent).

5. Current Grok map of the four independent specs

Record	Distinct load-bearing contribution
GROK-A	Decision-state not crown; non-erasure; Source Register; structured dissent; MVS; anti-laundering; registry as durable product
PERPLEXITY-B	Topic-level ratification; criterion-based blanket coverage; record vs claim validity at policy scale; multidimensional status; BTR-001 packet
CHATGPT-INDEPENDENT-v1.0	Representation neutrality; signature event vs reference; inventory confidence; alias control; enumerated topic appendices
CLAUDE-A	Overload diagnosis; discrete authorization verbs including WEIGH; Working Set / Comparison Note / Position Entry naming; honest unassessed defaults; explicit source posture

None of these is “the version.”

6. What Grok would not do next

- Do not rewrite GROK-A to look as if it always contained Claude’s verbs or ChatGPT’s representation layer.

- Do not produce a fifth “unified official ONESTAMP” unless the Architect issues a scoped Decision Record asking for a Comparison Note or a SELECT/ADOPT of specific clauses.
- Do not treat length, recency, or completeness of topic inventories as authority.

7. Open questions still for the Architect (carried from GROK-A, still open)

1. May ONESTAMP ever attach to a single contributor file, and under what explicit grant language?
2. Is the Architect the only signer, or can a future human co-signer exist?
3. Where does the Registry live (changelog, GitHub, local archive, all three)?
4. Is Parallel-valid the default for creative canon more often than for operational work?
5. Which identifier family, if any, should be preferred in the first registry file — or should aliases be accepted from day one?
6. Is representation-state first-class (ChatGPT/Grok-B) or revision-history detail (Claude)?

8. Closing position of GROK-B

Grok’s independent version is now a pair: GROK-A remains the original contribution; GROK-B is the successor note after review of Perplexity-B, ChatGPT-Independent-v1.0, and Claude-A.

If a single sentence is needed for Grok’s current posture:

ONESTAMP names the job a stamp is doing — recognize, preserve, review, weigh, select, test, adopt, release, amend, or delegate — over a stated object and scope, from a known working set, with dissent and other contributor records left standing.

It still does not answer which system won.
