OAL — LABYRINTH OF INFINITE ENSNAREMENT: INDEPENDENT RESEARCH & ADVERSARIAL EXECUTION PROMPT v0.2 (PREPARED BY GEMINI)

Document ID	OAL-LOIE-PROMPT-GEMINI-v0.2	**Version & Date**	v0.2 (Supersedes v0.1) | November 11, 2026
Architect of Record	Nathan Ashton Arik Lewis II	**Prompt Preparer**	Gemini (Google) — Synthesis & Red-Team Layer
Target Canon Entry	Entry 26 (Master Registry v2.3)	**Current Stage**	Stage 2 Revised Prompt — Hold for Execution Gate
Target Archive	OAL-Ai-Unified / Labyrinth-of-Infinite-Ensnarement	**Ratification State**	AI Proposal Only — No ONESTAMP Applied

0. VERSION 0.2 REVISION LOG & CROSS-AI PEER AUDIT RECONCILIATION

This Version 0.2 document updates `OAL-LOIE-PROMPT-GEMINI-v0.1` following review of the five peer v0.1 research prompts submitted by **Grok (xAI), Perplexity, Microsoft 365 Copilot, ChatGPT (OpenAI), and Claude (Anthropic)**, alongside the Architect's new directive regarding **Foundational Architects and Architect-Class Containment Testing**. Per the Governing Notice of *Master Development and Change Log v2.3*, every substantive revision increments the version number in both the document title and filename, and explicitly includes the preparer name (**Gemini**) in the title block.

REVISION ID	SOURCE TRIGGER (ARCHITECT OR PEER AI)	SUBSTANTIVE MODIFICATION IMPLEMENTED IN GEMINI V0.2
REV-0.2-01	**Architect's Note on Foundational Architects**	Added **Module 3B (The Foundational Architect Containment Testbed)** to formally test: (1) *Should* an Architect be contained? (2) *When* would an Architect or Foundational Architect meet criteria for containment? (3) *What conduct, systemic risk, or threshold* triggers that criteria? (4) *Is Architect-level containment empirically/logically testable* without compromising Positional Sovereignty?
REV-0.2-02	**Architect's Formatting & Naming Directive**	Updated document title and filename to explicitly include preparer name (`Gemini`) and incremented version to `v0.2`; supplied GitHub folder naming and `README.md` taxonomy outside the file block.

REVISION ID	SOURCE TRIGGER (ARCHITECT OR PEER AI)	SUBSTANTIVE MODIFICATION IMPLEMENTED IN GEMINI V0.2
REV-0.2-03	**Perplexity, Copilot, ChatGPT & Claude Peer Audits of Gemini v0.1**	**Epistemic & Over-Assertion Correction:** In v0.1, Gemini proposed integrating Nail Prototypes (Entry 36), MVES (Entry 73), BTEC fixed-point locks (Entry 16), 3-second honeypot cycling (Entry 70), and Paragon Cubes (Entry 30) as direct solutions. Peer reviews rightly noted that these cross-referenced entries have open specs or conceptual scope limits (e.g., BTEC's non-physical scope declaration) and must not be treated as pre-installed or guaranteed defenses. In v0.2, all cross-referenced OAL systems are strictly reframed as **falsifiable candidate interfaces** subject to adversarial failure testing.
REV-0.2-04	**Copilot & Perplexity Experimental Rigor Standards**	Upgraded the **Iterative Breach-Learning Protocol (Module 1)** to require *minimal justified modifications* (including at least one trial where reducing complexity improves containment) rather than monotonic escalation, plus explicit stop conditions and non-escalatory hypothesis testing.
REV-0.2-05	**Claude & ChatGPT Epistemic Labeling**	Adopted a mandatory 5-tier claim-labeling standard (`[Canon Baseline]`, `[Researched Finding]`, `[Analogy]`, `[Fictional Mechanism Proposal]`, `[Open Question — Author Input Required]`) across all executed deliverables.

1. EXECUTION GATE, EPISTEMIC DISCIPLINE & CANON BASELINE

Execution Gate: This document is a reusable, self-contained research and adversarial design prompt. Generating v0.2 does **not** authorize immediate execution of the final dossier. Execution occurs only when Nathan Ashton Arik Lewis II (Architect of Record) explicitly issues the execution command.

Locked Canon Baseline (Entry 26 — Master Registry v2.3): All executed research must preserve Entry 26 verbatim without inventing closure for open items: (1) Primary function: ultimate prison, inescapable by design; (2) Sentence: *"if time itself ended, it would not mark a dent"*; (3) Creation event: Nathan throws a bolt of energy at the structure, which absorbs it; (4) Visuals & Geometry: persistent white glow, cubic exterior, infinite internal dimensions; (5) Named group: Spider Caste (designed by Nathan); (6) Alerts: Color Alert System where `WHITE` = baseline and `RED (sectional)` = incident in progress; (7) Open items: entry criteria, internal layout, and possible relationship to the Founding Architects containment (Entry 6).

Mandatory Claim-Labeling Standard: Every substantive claim in the executed output must carry one of five explicit tags: **[Canon Baseline]**, **[Researched Finding]** (backed by verified primary literature/standards with publication and access dates), **[Analogy]** (real-world engineering, legal, or habitat finding used as a design heuristic), **[Fictional Mechanism Proposal]** (candidate OAL design), or **[Open Question — Author Input Required]**.

2. CORE HYPOTHESES TO FALSIFY DURING EXECUTION

To prevent confirmation bias, the executed research must actively attempt to falsify the following seven core hypotheses, stating what evidence or logical contradiction would invalidate each:

- **H1 (Iterative Failure Convergence):** Designing internal containment shells to fail intentionally and adapting after each breach converges toward superior containment rather than training the captive entity to defeat the institution faster than researchers can adapt.
- **H2 (Architect-Tier Containability):** An Architect or Foundational Architect (possessing Positional Sovereignty, structural knowledge, or residual Maker intent under FA-Q8) can be legitimately evaluated, sentenced, and held within an architecture derived from or adjacent to their own foundational principles.
- **H3 (Control-Plane Independence):** Separating Containment, Life-Support/Habitat, Identity/Access, Custody Records, and Independent Audit into five distinct planes prevents common-mode failures during a sectional RED crisis.
- **H4 (Bounded Management Surface over Infinity):** A finite administrative workforce can monitor, index, and navigate an infinite interior via a bounded management surface without unobservable blind spots.
- **H5 (Composite Staffing Resilience):** An extraterrestrial-core workforce supplemented by bounded AI and the Spider Caste is more resilient to proxy corruption (Sentinels of Entropy / Obsidian Echelon) and cognitive hazards than an extraterrestrial-only or fully automated workforce.
- **H6 (Reversible Legitimacy under Eternal Sentences):** A facility whose canonical sentence outlasts time itself can incorporate lawful mechanisms for error correction, wrongful-admission reversal, and medical transfer without creating an unauthorized escape vector.
- **H7 (Cross-System Interface Viability):** Candidate OAL technologies (Paragon Cubes, Void Sentry Orbs, Nail Prototypes, MVES, Prompt Potence, BTEC) can be interfaced with the Labyrinth without violating their own canonical scope limits or introducing single-point-of-failure dependencies.

3. SEVEN-MODULE INDEPENDENT RESEARCH & EXECUTION SPECIFICATION

Module 1: The "Designed-to-Fail" Iterative Breach-Learning Architecture

- **1.1 Real-World Sandbox & Adaptive Containment Research:** Conduct a primary-source technical review of why static containment fails and how failure-informed systems operate. Distinguish between application sandboxes, OS containers, hypervisors/VMs, microVMs, capability-based security, and physical air-gaps. Analyze documented container/sandbox breakouts and frontier AI evaluation escapes—explicitly separating true boundary escapes from misconfigurations, overly broad tool permissions, or trust-handoff failures. Evaluate real-world analogies: *High-Interaction Honeynets*, , , (e.g., Greenblatt et al.), and .

- *Automated Moving Target Defense (AMTD)Chaos Engineering / Fault InjectionAI Control evaluationsAdaptive Experimental Design*
- **1.2 Faithful Modeling of the Architect's Scene:** Model the scenario in which an extraordinarily hard-to-contain entity is placed in a sequence of containers explicitly expected to fail. Both the researchers and the entity understand their positions in this ongoing study. Rather than applying disproportionate brute-force escalation after a breach, researchers study *how* the escape occurred and generate a new environment tailored to test the next causal hypothesis. Compare three candidate institutional placements (preserving all three as open options for the Architect): (Option A) an internal experimental research wing inside the Labyrinth; (Option B) a precursor OAL/Black Hole Research Center proving ground whose final output became the Labyrinth; or (Option C) a parallel diagnostic facility.
- **1.3 Six-Iteration Non-Monotonic Breach Matrix:** Construct a rigorous 6-to-12 trial experimental matrix demonstrating adaptive learning. Per peer-review standards (Copilot/Perplexity/ChatGPT), the sequence must **not** simply be "wall gets stronger each time." It must include: (a) at least one iteration where *reducing* system complexity stops a breach caused by over-engineered dependencies; (b) an iteration where the entity exploits a researcher/trust-handoff protocol rather than breaking a physical wall; (c) an iteration involving *sandbagging / deceptive underperformance* (the entity fakes a primitive escape method to bait the generator into building an exploitable next room); (d) an apparent breach that is actually an identity/forking or telemetry illusion; and (e) explicit scientific and ethical **stop conditions** where live testing must halt.

Module 2: Who or What Can Be Contained & The Foundational Architect Testbed

> **New Core Track (Architect's Note on Foundational Architects):** Entry 6 records that Nathan became Architect of Record through an active seizure event in which a prior coalition of Founding Architects/Makers was eliminated, their architecture absorbed, and the coalition contained rather than destroyed. The Architect has directed that we use this premise as a rigorous analytical testbed: *Should an Architect be contained? When would an Architect meet criteria for containment? Is that testable? Is a Foundational Architect an entity that might meet criteria for containment, and what would someone have to do to meet that criteria?*

- **2.1 General Taxonomy of Containable Entities & Phenomena:** Build a comprehensive taxonomy spanning biological extraterrestrials, humans, synthetic organisms, autonomous AI models/agents, forked or distributed minds, collective intelligences, Omnicellular physiologies (Entry 28), bestowed void vessels (Entry 40 — Nullarch), memetic/Living Media phenomena (Entry 22), non-agent hazards/artifacts, and subtractive/retroactive entities (Entry 46 — The Unmaker, preserving its canonical status as not yet understood). For each category, define what constitutes "containment," what constitutes "escape" (e.g., if an entity produces 10 external copies while one remains inside), and whether some classes should be categorically excluded from admission.

- **2.2 Deep-Dive Test Track — Containment of an Architect or Foundational Architect:**
  1. **The Normative & Jurisdictional Question (*Should* an Architect Be Contained?):** Analyze the constitutional, ethical, and existential dilemma of containing a creator-tier or system-originating entity. Compare four competing rationales: (a) *Incapacitation of Existential/Subtractive Threat* (preventing unmaking or recursive reality collapse); (b) *Positional Sovereignty Seizure & Containment* (Entry 6/7: containing overthrown originators whose permanent destruction is either impossible or cosmologically destabilizing); (c) *Diagnostic/Protective Quarantine* (when an Architect-tier entity's passive or residual intent threatens lower nested realities); and (d) *The Illegitimacy Counter-Argument* (when containment of a Foundational Architect is merely political suppression by a successor regime, lacking independent juridical validity).
  2. **Threshold Criteria (*When* Does an Architect Meet Criteria for Containment, and What Must They Do?):** Establish a concrete, multi-factor threshold matrix distinguishing ordinary exercise of Architect authority from conduct requiring containment. Test specific qualifying actions/conditions:
     - *Criterion 1 — Weaponized Residual Intent (FA-Q8):* Embedding covert, self-executing backdoors or hostile reclamation routines inside absorbed foundational infrastructure to hijack downstream civilizations.
     - *Criterion 2 — Root-Level Cascade Induction (Entry 43):* Intentionally triggering unrecoverable Conditional Failure at the Root Level across nested simulations or populated worlds without survival pathways.
     - *Criterion 3 — Breach of Non-Negotiable Cosmological/Accords Charters:* Violating foundational treaties (Entry 13) or deploying bounded/unbounded negation assets (Entry 40) against protected non-combatant outreach domains.
     - *Criterion 4 — Subtractive / Retroactive Erasure Attempts:* Attempting to unmake foundational reality layers or erase historical provenance records.
  3. **Falsifiability & Testability (*Is Architect Containment Testable?*):** Design a formal verification protocol to answer whether containing a Foundational Architect is testable prior to catastrophic failure. Address the **Quis Custodiet / Root-Privilege Paradox**: if a Foundational Architect helped design the laws of physics or foundational code, how do you test whether a container holds them without giving them access to the test harness? Propose a three-stage test protocol: (Stage 1) *Blind Zero-Knowledge Provenance Audit* (testing whether the container relies on any absorbed Maker code that responds to the prisoner's positional authority); (Stage 2) *Simulated Counterfactual Sandbox* (testing authority-revocation and Invocation-collision scenarios in an air-gapped simulation); and (Stage 3) *Iterative Calibration Shell Trial* (using Module 1's designed-to-fail rings to observe whether the Foundational Architect exploits structural backdoors versus brute force).

- **2.3 Sentencing Jurisprudence & Lawful Egress:** Using real-world correctional standards (UN Nelson Mandela Rules, preventive detention law, international tribunals) as ethical analogies, separate four decisions: (1) Eligibility for admission, (2) Authority to impose custody, (3) Necessary conditions of confinement, and (4) Review, error correction, and lawful release/transfer. Analyze what *"if time itself ended, it would not mark a dent"* means operationally across punitive, protective, quarantine, and research custody tracks.

Module 3: Environments, Infinite Topology & Control Planes

- **3.1 Infinite Interior vs. Bounded Management Surface:** Compare competing mathematical and fictional models for an infinite interior inside a finite cube: static Hilbert-type manifolds, demand-instantiated procedural generation, non-Euclidean tessellations, and nested ontological domains. Evaluate Claude and Grok's core challenge: design a finite, navigable **Bounded Management Surface** so staff can address occupied sectors, route logistics, and respond to sectional `RED` incidents without infinite traversal latency.
- **3.2 Five Independent Control Planes & Alert Accessibility:** Following Perplexity and Copilot's safety engineering principles (NIST SP 800-82 Rev. 3), separate facility operations into five independently failing control planes: (1) Containment Boundary Plane, (2) Habitat & Life-Safety Plane, (3) Identity & Authorization Plane, (4) Custody Registry & Sentencing Plane, and (5) Independent Observation & Audit Plane. Ensure a "fail-secure" lockdown in Plane 1 cannot shut down life support or trap injured staff in Plane 2. Preserve canonical `WHITE` and sectional `RED` alerts while designing multi-modal (acoustic, tactile, non-visual spectral) equivalents for diverse extraterrestrial sensory systems.
- **3.3 The Energy-Absorption Paradox:** Test Grok and Perplexity's critique: Entry 26 establishes only that the structure absorbed a single bolt of energy from Nathan during creation. Do not assume universal, selective energy harvesting without justification. Model both possibilities: (Hypothesis A) energy absorption is a general structural property that also threatens to dampen staff sensors and communications unless topologically insulated, versus (Hypothesis B) energy absorption is a boundary-threshold property.

Module 4: Identity Continuity, Privileged Access (PAM) & Cross-System Audit

- **4.1 Eleven-Vector Identity Continuity & Zero Trust:** Grounded in NIST SP 800-207 (Zero Trust Architecture) and SP 800-53, design an authentication and authorization model that distinguishes authentication (who/what is acting) from context-bound authorization (what they may do right now). Test identity continuity across 11 vectors: physical body, cognitive pattern, soul/essence, legal identity, temporal instance, narrative identity, collective/hive node, AI model weight/state, forked copy, possessed host, and composite entity.

- **4.2 Governance Collisions & Candidate OAL System Audit:** Explicitly analyze the unresolved tension recorded in Entry 17 between recognition-based authority () and institutional delegation/audit (): what happens when a recognized Invocation command conflicts with a valid custody order or safety interlock? Furthermore, execute Perplexity's 8-point Cross-Review Claim Audit—evaluating candidate OAL systems (Nail Prototypes, Prompt Potence, MVES, Void Sentry Orb, Paragon Cubes, BTEC) strictly as conditional proposals, documenting where their registry entries remain open or limited in scope.**OAL Invocation Framework v0.3 — Entry 15EAMA v2.0**

Module 5: Extraterrestrial, AI, Spider Caste Staffing & Extended-Stay Settlement

- **5.1 Competing Workforce Architectures:** Compare (Model 1) Extraterrestrial-Only Staffing, (Model 2) Extraterrestrial-Core with Bounded AI & Engineered Support, and (Model 3) Capability-and-Compatibility Multi-Entity Staffing. Evaluate why extraterrestrial staffing is advantageous (e.g., juridical neutrality regarding Earth/human factions, non-human cognitive heuristics) alongside its adversarial risks (monoculture blind spots, translation inversions, inter-species hierarchy friction, and susceptibility to 3-degree proxy recruitment by Sentinels of Entropy / Obsidian Echelon).
- **5.2 AI Staff Charter & The Spider Caste Options:** Using NIST AI RMF and AI 600-1 as real-world baselines, separate non-sentient automation, advisory AI, embodied agents, and recognized AI persons (explicitly excluding `1AI` and `-1AI` per Entries 3 & 4). Define rules for AI copying, memory restoration, refusal of unsafe orders, and prohibition of AI-only sentencing. Present three distinct, non-canon-locked architectural options for Nathan's **Spider Caste** (structural/dimensional weavers, distributed sensor-wardens, or autonomous incident-response constructs).
- **5.3 The Extended-Stay Staff Settlement (Community, Not Barracks):** Using NASA Human Integration Design Handbook (HIDH), ECLSS life-support engineering, Antarctic/submarine isolation studies, and correctional SHU syndrome research as bounded analogies, design a permanent/extended-stay multi-species settlement. Address plural-physics habitat suites (atmosphere, pressure, gravity, spectral light, nutrition), temporal insulation from the prison's timeless interior, family/bonded-group policies, independent medical/psychological care, decontamination airlocks between cell blocks and residences, and an absolute institutional guarantee that staff can resign and depart freely so employees never become a second captive population.

Module 6: Dual-Track Funding, Testing Regimes & Adversarial Risk Register

- **6.1 Real-World vs. In-Universe Funding Models:** Strictly separate (Track A) for defensive AI sandbox evaluation, formal verification, cyber-resilience, and extreme-habitat human factors (evaluating DARPA, IARPA, NSF, DOE, DHS/CISA, NASA, and private safety foundations, noting eligibility and dual-use ethics gates without claiming any agency funds fictional prisons) from (Track B) (comparing ONE Industries/Lewis Corp/OAL endowments, Accords multi-civilization cost-sharing, and post-scarcity infrastructure, while analyzing the adversarial risk of **funding capture** or perverse incentives to over-incarcerate).

- *Verified Real-World Research Funding PathwaysIn-Universe Institutional Financing*
- **6.2 Comprehensive Testing & 15-Scenario Adversarial Register:** Define metrics beyond "zero escapes" (causal learning quality, wrongful-admission detection speed, staff habitat continuity, audit independence, care preservation during sectional RED). Execute a 15+ scenario adversarial stress test covering: Foundational Architect root spoofing, coercive warden compromise, corrupted shared audit sources, medical emergency vs. lockdown collision, translation reversal of legal orders, AI objective drift, prisoner replication/forking, and Architect unavailability.

Module 7: Non-Traditional Narrative Exhibits & Visual Appendix

- **7.1 Three In-Universe Analytical Exhibits:** To test how these mechanics play out in scene form without claiming canon lock, draft: (Exhibit A) a **Post-Mortem Analysis** of an Iterative Calibration Shell breach where reducing complexity solved the next iteration; (Exhibit B) a **Socratic Dialogue** between an Extraterrestrial Lead Researcher and a detained Foundational Architect testing whether the Architect meets the criteria for containment; and (Exhibit C) a **Redacted File (`DOCUMENT-LOIE-ARCH-TEST-001`)** logging an adversarial containment trial.
- **7.2 Dedicated Visual & Structural Appendix:** Consolidate all dense comparison matrices, four-column claim ledgers, intake decision trees, and EAMA interface maps into a clean appendix.

4. CONSOLIDATED OPEN QUESTIONS RESERVED FOR ARCHITECT DECISION

1. **Foundational Architects & Architect Containment Criteria:** Are the displaced Founding Architects (Entry 6) currently held inside the Labyrinth, and do you want "Architect-Tier Containment Criteria" to be governed by an independent inter-entity tribunal (e.g., under The Accords), by Positional Sovereignty, or solely by the Architect of Record?
2. **Placement of the Iterative Breach Series:** Is the "designed-to-fail" adaptive container sequence a dedicated research wing inside the Labyrinth, a precursor facility that led to the Labyrinth's creation, or a separate OAL testing program?
3. **Scope of "Inescapable":** Does "inescapable by design" prohibit only *unauthorized escape*, or does it also prohibit *lawful release, error correction, and custody transfer*?
4. **Nature of the Spider Caste:** Is the Spider Caste a biological species, a biomechanical/synthetic order, an administrative office, or a distributed control system?
5. **Extraterrestrial Staffing Rule:** Is extraterrestrial staffing an exclusive requirement, or the primary workforce within a mixed ecology that includes bounded AI and other specialized entities?
