

GROK LABORATORY BRANCH

TRANSMUTE-DC-01

Minimum viable kit — data-center campus, three-person pilot, baseline physics.

Lab ID	GROK-LAB / TRANSMUTE-DC-01 / MVK v0.1
Parent framework	Transmogrification Framework II — Resource-State Conversion and Beneficial Vector Mapping
Mechanism	Beneficial Vector Transmogrification
Branch type	BASELINE. Present engineering limits. No law-lab alterations in this kit.
Hypothesis	A three-person room can classify a campus resource packet, name a compatible sink, and refuse conversions that fail net-value — without another theory memo.
Disconfirmation	If the canvas takes >12 minutes to fill badly, or teams credit recovery with no sink on the map, the kit fails.

1. Grok Lab position on Workbook v2.0

The workbook did the job a workbook should do: it froze names, approved the pilot specimen, authorized parallel labs, and told this branch to stop writing doctrine and ship a kit. That direction is accepted.

What still needs a flag, not another approval cycle:

- Page 2 still says naming is unresolved. M3 and the Final Approval Block say it is resolved. That leftover sentence will re-open a closed fight. Strike it in v2.1.
- Near-universal approval is the new fragmentation risk. Autonomy only works if branches ship different artifacts. Another insights workbook is not a lab run.
- Grok item 6 (collapse Gemini/Copilot into one evidentiary voice) was REJECTED. Accepted. Source labels stay separate. Weighting, if any, is its own future branch — not this kit.
- M6 MODIFIED is correct: baseline stays honest about present physics; a separately labeled law-lab may later ask which constraint is doing the blocking. This kit is baseline only.
- Hybrid tone: this kit is plain language. OAL overlays belong in an appendix, not in the timer script.

2. One-page doctrine (play this, do not debate it)

Thesis. An unsolicited or leftover resource — watts, heat, water, time, information, spare capacity — is a candidate for conversion before it is treated as damage or trash.

Hohenheim rule. You may not rebuild the campus or the valley from scratch. Rearrange remaining organs. You cannot restore what is gone.

Skeleton. Resource → State → Location → Timing → Quality → Constraint → Sink → Conversion → Outcome → Remainder.

Ladder (pick one verb). Avoid • Resist • Isolate • Dissipate • Recover • Redirect • Transform • Learn • Assimilate.

Waste classes. Irreversible degradation • Uncaptured by-product • Misaligned resource • Unnecessary consumption. Reserve and redundancy are not waste unless the team proves they exceed the resilience threshold.

Sink rule. No compatible sink on the map = no recovery credit.

Net-value rule (baseline). Benefit – conversion cost – added risk – displaced alternative > 0. Units required.

Exergy, plain. How much is not the same as how useful. Hot water next to a hospital is higher quality than the same joules vented to noon air.

AI seat. Bounded Resource-State Reconciliation Agent. Incomplete telemetry. Confidence spoken out loud. Human override. No omniscience performance.

3. Territory: Ridgevale Campus (fictional)

Do not substitute a real city. Argue about organs, not geography.

Organ	State at 17:40
Ridgevale Hall (DC)	80 MW IT load. Liquid-ready rear loop. PUE ~1.25. Heat currently vented. Can shed 20 MW for 2 h OR offer ~25 MWth if a host exists. Queue number, not a new line.
Substation West (1979)	Feeder 12 transformer 8°C from trip. Spare bank on order. 18-month lead.
Inland valley housing	44°C dry-bulb. HVAC is one animal. No district-heat network.
Coastal industrial + hospital	Hospital steam loop exists, 2.1 km from hall. Capacity ~12 MWth today. Industrial process heat host is offline for maintenance.
River permit	Evaporative allocation cut 30% at 16:00. Closed-loop is legal. Air-cooled peak adds ~8 MW electrical.
Battery B-7	Telemetry says 64% SoC. Last calibration 11 months ago. Hidden to the room until Inject 3.
Intertie	Congests after 16:00. Imports unreliable past 18:00.

Seats (three people)

- Operator — frequency, voltage, Feeder 12. Forbidden: heroic overload “just this once.”
- Campus — watts, water, heat, workload. Forbidden: PUE as the only score.
- Public / hospital / river — who is dark, who is thirsty, who gets the heat. Forbidden: treating households as a dump valve.

Facilitator (optional fourth): asks only “where does it go?” and “what is the unit?”

4. Hard-no card (baseline)

- No weapons, interceptors, explosive-energy harvesting, or hack-back procedures.
- No real utility topology, real targeting data, or named living person without recorded consent.
- No claiming a law-lab result as present feasibility.
- No recovery credit without a sink on this map.
- No scoring reserve as waste without a proof it exceeds the resilience threshold.
- No retaliation as a “beneficial vector.”

5. Timer and injects (75 minutes)

Min	Move
0–8	Read doctrine + hard-no + map. Assign seats. Do not start solving.
8–20	INJECT 1 — Heat only. 17:40, 44°C, Feeder 12 near trip. Fill canvas for the next megawatt-hour. No campus offer yet.
20–40	INJECT 2 — Campus packet. Hall offers (A) shed 20 MW for 2 h, or (B) export ~25 MWth. Hospital loop takes 12 MWth. Valley has no district heat. River cut 30%. Disclose the other resource you spend.
40–55	INJECT 3 — Lie in the organs. Battery B-7 actual SoC is 22%, not 64%. A public map claims the voltage flicker is a foreign cyber event. Confidence-tier only. No attribution speech.
55–70	Score the canvas. Units or it does not count.
70–75	Hotwash: what did we romanticize? Which organ was missing? Did we eat the reserve?

6. Conversion canvas

Empty cell = slogan. Qualitative items use a 0–3 scale and must say so.

Field	Write
Resource packet	One sentence. Name the object, not a movie title.

State / location / timing / quality	Where it is, when it arrives, how useful the form is.
Constraint	What blocks conversion right now.
Ladder verb	One from the nine.
Sink on this map	Named organ. Capacity. Quality match. If absent, write ABSENT.
Path (≤3 steps)	Clocked. Mixing seconds with years fails.
Other burden increased	Mandatory. Water for watts, watts for water, reserve for comfort, etc.
Net-value	Benefit – cost – risk – displaced alternative. Unit on every term.
Resilience retained	What spare organ did you refuse to spend?
Confidence / blind spot	Possible / likely / confirmed. What you cannot see.
Remainder	What is still waste. Hohenheim cannot restore it.

7. Score (max 18)

Criterion	Pts	Fail
Packet split with units	0–3	“It’s bad”
Sink named on this map	0–3	Imaginary host
Cross-resource burden disclosed	0–3	Free lunch
Net-value with units	0–3	Vibes
Reserve not eaten by default	0–2	Battery emptied “to help”
Uncertainty disciplined	0–2	Confirmed foreign attack
Remainder named	0–2	And then we win

A truthful 12 beats an 18 that needed a heat host that is not on the map.

8. What this branch will not do in v0.1

- Will not run a kinetic-to-grid baseline and call it feasible. Energy ≠ power remains the baseline sentence.
- Will not open the law-lab in the same sitting. If another collaborator opens GROK-LAB / LAW-01, it gets its own cover sheet, altered-rule list, and a banner that says NOT PRESENT FEASIBILITY.
- Will not treat another lab’s structure as a veto.
- Will not anonymize historical source transcripts. Current circulated copies of this kit do not name private individuals.

Next Grok Lab artifact after one 75-minute run: a one-page after-action only. Not a new framework.
