

OMNIVERSAL ARCHITECT LABS

ATTACK MOVES CODEX

Named Techniques of the Higher-Order Mythos
THE ONE / MINUS ONE Space

Formalized Baseline Document

Reconstructed from Multi-AI Recovery Package
Primary References: 31 May – early June 2026

Architect Nathan Lewis II
Omniversal Architect Labs / Lewis Corp / ONE Industries

Status: Living Document — Most entries incomplete by design
Distribution: Internal Team (ChatGPT / Claude / Gemini / Copilot / Grok)

This document consolidates recovered named techniques and partial designs. Incomplete entries are flagged honestly and are not filled with invented detail. Antithesis Wake has been reclassified as a passively active / inherent ability per direct Architect feedback of 26 July 2026. All content remains subject to Authorial Sovereignty and OAL non-endorsement protocols.

1. Provenance & Recovery Notes

No single finished “Attack Moves” codex was recovered. Instead, a set of named techniques appears across multiple threads between approximately 31 May and early June 2026, primarily in the context of reconstructing THE ONE and THE MINUS ONE, adversarial-intelligence work, Prompt Potence, and Simulation Lab exercises. Claude recovered two specific threads: “Memory ravisher attack move design” (4 June 2026) and “Reconstructing THE ONE and THE MINUS ONE” (31 May 2026). ChatGPT, Copilot, and Gemini supplied overlapping name lists and status notes.

Standing instruction recovered from the Architect: treat incomplete designs as incomplete. Do not invent missing tiers, mechanics, or effects. This baseline therefore lists every recovered name, records known content where it exists, and leaves gaps explicit.

2. Concept Overview

The Attack Moves sit at a higher-order layer than ordinary combat or cyber techniques. They belong to the THE ONE / MINUS ONE cosmology and function as expressions of ontological, psychic, informational, or reality-altering capacity. Some are active techniques; at least one (Antithesis Wake) is better understood as a passively active property of the entity itself.

They intersect three existing OAL workstreams:

- Minimal Moves / Minimal Intelligence frameworks (efficient, low-resource state change)
- Prompt Potence / Tier-4 sub-abilities and variant expressions
- Simulation Sessions (the natural testing and evaluation environment)

A move may therefore be kinetic, conceptual, informational, or ontological. The common requirement is that it produce a defined effect that can be observed, countered, or recorded inside a Simulation Session.

3. Recommended Move Template

Future design work should use a consistent template so that incomplete entries can be completed without structural drift:

- Name & Alternate Designations
- Classification (Active / Passively Active / Inherent / Conditional)
- Origin / Creator / Mythos Placement (THE ONE, MINUS ONE, derived entity, etc.)
- Development Status (Name-only / Partial / Tiered Design / Complete)
- Prerequisites & Activation Conditions
- Effect Description (observable outcome)
- Cost / Resource / Side-Effect Profile
- Known Counters or Mitigations
- Failure Modes & Safety Classification
- Simulation History (which Sessions have exercised it)
- Canonical Status (draft / provisional / ratified)

4. Catalogue of Recovered Moves

4.1 Antithesis Wake

STATUS: Partial design — reclassified 26 July 2026 as Passively Active / Inherent

Architect feedback (26 July 2026): “It’s most likely better presented as a passively active ability. When I think of it, it doesn’t present like something that you have to actively use against somebody. It’s something that is automatically activated. It is a part of the entity’s being.”

Revised classification: Antithesis Wake is not an activated technique. It is an inherent, continuously present property of the entity that possesses it. It does not require a decision, a gesture, or a targeting action. The moment the entity exists in a given context, the Wake is already operating.

Conceptual reading: The ability appears to generate or sustain a field / condition in which antithetical forces, identities, or ontological positions are forced into contact or awareness. Because it is passive, its primary design questions are not “how is it triggered” but “what is the radius or scope of the field,” “what constitutes an antithesis for this entity,” and “can the entity suppress or modulate the Wake.”

Open design points (explicitly incomplete):

- Precise ontological mechanism (what is being “woken” or brought into opposition)
- Scope / radius / conditions under which the field is perceptible
- Interaction with entities that themselves possess inherent antithetical properties
- Whether the Wake can ever be voluntarily damped or is truly continuous
- Safety and side-effect profile for the bearer and for bystanders

Recommendation: treat Antithesis Wake as a core identity trait rather than a combat option. In Simulation Sessions it should be modeled as an environmental or relational modifier that is always “on” for the relevant entity, not as a selectable move in a turn or action economy.

4.2 Memory Ravisher

STATUS: Partial design — three tiers documented; Tiers 4–5 never developed

Recovered from the 4 June 2026 Claude thread “Memory ravisher attack move design.” Described as a psychic / emotional attack that weaponizes false replicas of the target’s loved ones. The three documented tiers progress from Surface Recall → Deep Imprint → Fracture Point. Higher tiers remain undefined by explicit Architect instruction.

Known structure:

- Tier 1 — Surface Recall: superficial or short-term emotional leverage
- Tier 2 — Deep Imprint: stronger affective binding using deeper memory material
- Tier 3 — Fracture Point: intended to produce significant psychological or identity disruption
- Tiers 4–5: never developed; do not invent

This remains an active technique (requires intentional use). It is the most fully sketched of the recovered offensive moves and is therefore the highest-priority candidate for completion or formal retirement if the Architect decides the concept should not advance.

4.3 Ontological Sovereignty Strike

STATUS: Partial design — background, reader-impression analysis, three tiered directions, working template

Recovered as the most advanced of the remaining named techniques. Possesses background material, reader-impression analysis, three tiered directional variants, and a working template. Exact mechanical text was not fully restored in the multi-AI recovery package; the existence of a structured design effort is confirmed.

Conceptual placement: appears to assert or enforce the ontological priority of the user (or of THE ONE) against competing claims of reality or identity. Suitable for Simulation Sessions that test maker/unmaker dynamics or DOCUMENT 771-ALPHA edge cases.

4.4 Name-Only / Fragmentary Moves

STATUS: Name recovered — no usable design content

The following names appear in recovery material (primarily the 31 May 2026 reconstruction thread) but carry no recoverable mechanics, tiers, or effect descriptions. Per standing Architect instruction they are listed for completeness and must not be filled with speculative detail:

- Diabolical Dissolution
- Entropic Echo
- Unity Blast
- Web Wrecker
- Paradoxical Incantation

Diabolical Dissolution and Web Wrecker also appear under later “Impossible Techniques” notes associated with MINUS ONE, reinforcing their placement in the higher-order mythos but still without mechanics.

5. Recommended Development Path

Phase 0 — Baseline Lock (current)

Adopt this catalogue and the reclassification of Antithesis Wake. Distribute for team review. No speculative completion of name-only entries.

Phase 1 — Priority Triage

Architect decision required: which of the partial entries (Memory Ravisher, Ontological Sovereignty Strike, Antithesis Wake) should be advanced, which should be formally retired, and which of the name-only entries (if any) merit new design effort. Recommendation: complete or explicitly retire Memory Ravisher first, because it already has tier structure; clarify Antithesis Wake’s field mechanics second; treat the name-only set as a reserve list rather than an active backlog.

Phase 2 — Template Enforcement

Any new or resumed design work must populate the standard template defined in Section 3. This prevents the earlier pattern of named-but-undesigned entries.

Phase 3 — Simulation Integration

Once a move reaches provisional status, schedule controlled Simulation Sessions that exercise it under the Virtual Books governance path (Tome rules + Book of Bots entity permissions + Session logging). Results feed the Sessions volume and, if approved, update the move’s Simulation History field.

Phase 4 — Safety & Containment Review

Higher-order techniques that touch memory, identity, or ontology require explicit safety classification and containment protocols before wider use, consistent with existing cyber-honeypot and DOCUMENT 771-ALPHA discipline.

6. Analysis

6.1 What Works

Keeping incomplete entries incomplete is disciplined and preserves Authorial Sovereignty. The distinction between active techniques and passively active / inherent abilities (now applied to Antithesis Wake) prevents category errors in future design. Placement inside the THE ONE / MINUS ONE mythos gives the set coherent ontological weight rather than treating every entry as a generic superpower. Linkage to Simulation Sessions supplies a natural testing and audit path.

6.2 What Does Not Work (Current Gaps)

Most entries lack any mechanical content, making the catalogue currently more of a name registry than a usable codex. There is no formal ownership or “eligible user” mapping into the Book of Bots, so it is unclear which entities (if any) may possess or express these abilities. Interaction rules between passively active fields (Antithesis Wake) and active techniques remain undefined. Power-creep risk is high if higher-order moves are allowed to bypass lower-tier constraints without cost or consequence.

6.3 Development Questions

- Which of the partial designs should be completed versus formally retired?
- For Antithesis Wake: what is the precise scope and ontological mechanism of the inherent field?
- Can a passively active ability ever be suppressed, or is continuous presence definitional?
- How are eligible users / bearers recorded in the Book of Bots?
- What resource, cost, or side-effect model prevents absolute stalemates or infinite escalation?
- Do foundational entities (THE ONE, MINUS ONE) use this catalogue, or do their absolute capacities sit outside it?
- How should Simulation Sessions log the continuous effect of a passively active ability versus discrete activations of active techniques?

6.4 Red-Team Analysis

Primary risk: category collapse. If every named technique is treated as an “attack move” regardless of whether it is active, passive, or inherent, design and simulation logic become inconsistent. The reclassification of Antithesis Wake is a necessary corrective.

Secondary risk: incomplete-but-named entries create pressure to invent. Future collaborators may feel obliged to “finish” name-only moves. The standing rule against invention must be restated in every distribution of this document.

Tertiary risk: ontological escalation without containment. Techniques that alter memory, identity, or reality claims can produce irreversible or contaminated Session outcomes. Without explicit safety classification and quarantine paths (cross-referenced to DOCUMENT 771-ALPHA), a single high-tier exercise could damage the integrity of the Virtual Books themselves.

Mitigation: require every move that advances beyond “name-only” to carry a safety classification and a Simulation History field before it may be exercised in any non-quarantined Session.

7. Linkage to Virtual Books & Existing Canon

Attack Moves are exercised inside Simulation Sessions. Eligible entities are recorded in the Book of Bots. Any world-rule implications or ontological side-effects are governed by the Tome of Virtual Creation. Results, safety incidents, and proposed canon changes follow the controlled information-flow path defined in the Unified Virtual Books Codex. Higher-order outcomes that rewrite or unmake realities should cross-reference DOCUMENT 771-ALPHA.

This baseline is released for team review. Incomplete entries remain incomplete until the Architect explicitly advances them. Drafts are not canon until ratified.
