

OMNIVERSAL ARCHITECT LABS

ATTACK MOVES CODEX

Named Techniques of the Higher-Order Mythos
THE ONE / MINUS ONE Space

Updated Baseline Document

*All eight recovered names approved for inclusion
Antithesis Wake reclassified as passively active / inherent*

*Architect Nathan Lewis II
Omniversal Architect Labs / Lewis Corp / ONE Industries*

Distribution: Collaborative Team (ChatGPT / Claude / Gemini / Copilot / Grok)

This document incorporates Architect decisions of 26 July 2026. Incomplete entries remain incomplete. No speculative mechanics have been invented for name-only moves. Antithesis Wake is treated as a passively active property of the entity's being. All content subject to Authorial Sovereignty.

1. Provenance & Approval Status

The eight named techniques were recovered from multi-AI history (primarily 31 May – early June 2026). On 26 July 2026 the Architect approved inclusion of all eight recovered names in this compendium. Detailed mechanics for most entries remain under development or are intentionally incomplete.

Standing rule (unchanged): do not invent missing tiers, effects, or mechanics. Entries are labeled Recovered Canon, Partial Design, or Name-Only. Development proposals, if later supplied, will be clearly marked as such and will not be presented as recovered material.

2. Concept Overview

These techniques belong to the higher-order THE ONE / MINUS ONE cosmology. They express ontological, psychic, informational, or reality-altering capacity. Some are active techniques; at least one (Antithesis Wake) is a passively active / inherent property of the entity that bears it.

They intersect Minimal Moves / Minimal Intelligence frameworks, Prompt Potence work, and the Simulation Sessions volume of The Three Foundational Books. Eligible entities are recorded in The Book of Bots. World-rule or ontological side-effects are governed by The Tome of Virtual Creation. Session results flow under the autonomy and provisional-authority rules defined for the Foundational Books.

3. Recommended Move Template

Future design work should populate the following fields:

- Name & Alternate Designations
- Classification (Active / Passively Active / Inherent / Conditional)
- Origin / Mythos Placement
- Development Status
- Prerequisites & Activation Conditions (or statement that none apply)
- Effect Description
- Cost / Resource / Side-Effect Profile
- Known Counters or Mitigations
- Failure Modes & Safety Classification
- Simulation History
- Canonical Status

4. Catalogue of Approved Moves

4.1 Antithesis Wake

STATUS: Partial design — reclassified 26 July 2026 as Passively Active / Inherent

Architect feedback (26 July 2026): “It’s most likely better presented as a passively active ability. When I think of it, it doesn’t present like something that you have to actively use against somebody. It’s something that is automatically activated. It is a part of the entity’s being.”

Revised classification: Antithesis Wake is not an activated technique. It is an inherent, continuously present property of the entity that possesses it. No decision, gesture, or targeting action is required. The moment the entity exists in a given context, the Wake is already operating.

Conceptual reading: The ability generates or sustains a field / condition in which antithetical forces, identities, or ontological positions are forced into contact or awareness. Primary design questions concern radius/scope, what counts as an antithesis for the bearer, and whether the Wake can be suppressed or modulated.

Open design points (explicitly incomplete):

- Precise ontological mechanism
- Scope / radius / perceptibility conditions
- Interaction with other inherent antithetical properties
- Suppressibility vs continuous presence
- Safety and side-effect profile for bearer and bystanders

Recommendation: model Antithesis Wake in Simulation Sessions as an always-on environmental or relational modifier for the relevant entity, not as a selectable action.

4.2 Memory Ravisher

STATUS: Partial design — three tiers documented; Tiers 4–5 never developed

Recovered from the 4 June 2026 design thread. Psychic / emotional attack that weaponizes false replicas of the target's loved ones. Documented progression: Surface Recall → Deep Imprint → Fracture Point. Higher tiers remain undefined by explicit instruction.

Known structure:

- Tier 1 — Surface Recall: superficial or short-term emotional leverage
- Tier 2 — Deep Imprint: stronger affective binding using deeper memory material
- Tier 3 — Fracture Point: significant psychological or identity disruption
- Tiers 4–5: never developed; do not invent

This remains an active technique. It is the most fully sketched offensive entry and the highest-priority candidate for either completion or formal retirement.

4.3 Ontological Sovereignty Strike

STATUS: Partial design — background, analysis, tiered directions, working template recovered

The most advanced of the remaining named techniques. Background material, reader-impression analysis, three tiered directional variants, and a working template exist. Exact mechanical text was not fully restored; the existence of structured design effort is confirmed. Conceptually asserts or enforces ontological priority against competing claims of reality or identity. Suitable for Sessions testing maker/unmaker dynamics or DOCUMENT 771-ALPHA edge cases.

4.4 Name-Only / Fragmentary Moves (Approved for Inclusion)

STATUS: Names recovered and approved — no usable design content

The following names are approved for inclusion in the compendium. They carry no recoverable mechanics. Per standing instruction they must not be filled with speculative detail:

- Diabolical Dissolution
- Entropic Echo
- Unity Blast
- Web Wrecker
- Paradoxical Incantation

Diabolical Dissolution and Web Wrecker also appear under later “Impossible Techniques” notes associated with MINUS ONE. Whether “Impossible Techniques” is the official umbrella category remains provisional pending further Architect clarification.

5. Recommended Development Path

Phase 0 — Baseline Lock (current)

All eight names are locked as approved for inclusion. Antithesis Wake classification is locked. No speculative completion of name-only entries.

Phase 1 — Priority Triage

Architect decision required on which partial entries (Memory Ravisher, Ontological Sovereignty Strike, Antithesis Wake) should be advanced versus formally retired. Name-only set remains a reserve list.

Phase 2 — Template Enforcement

Any resumed design work must populate the standard template. This prevents recurrence of named-but-undesigned entries.

Phase 3 — Simulation Integration

Provisional moves are exercised inside Simulation Sessions under The Three Foundational Books governance (including autonomous update and provisional-authority rules). Results update Simulation History fields.

Phase 4 — Safety & Containment

Techniques touching memory, identity, or ontology require explicit safety classification and containment protocols before non-quarantined use, consistent with DOCUMENT 771-ALPHA discipline.

6. Analysis

6.1 What Works

Keeping incomplete entries incomplete preserves Authorial Sovereignty. Distinguishing actively triggered techniques from passively active / inherent abilities (Antithesis Wake) prevents category errors. Placement in the THE ONE / MINUS ONE mythos supplies coherent ontological weight. Linkage to the Foundational Books supplies testing, logging, and autonomy pathways.

6.2 What Does Not Work / Gaps

Most entries still lack mechanical content. No formal eligible-user mapping into the Book of Bots yet exists. Interaction rules between inherent fields and active techniques are undefined. Power-creep risk remains if higher-order moves bypass constraints without cost. The status of “Impossible Techniques” as umbrella category is still provisional.

6.3 Development Questions (open)

- Which partial designs should be completed versus retired?
- Antithesis Wake: precise scope and ontological mechanism of the inherent field?
- Can a passively active ability be suppressed, or is continuous presence definitional?
- How are eligible bearers recorded in the Book of Bots?
- What cost / counter model prevents absolute stalemates?
- Do foundational entities use this catalogue, or do their capacities sit outside it?
- Is “Impossible Techniques” the official umbrella category?

6.4 Red-Team Analysis

Primary risk: category collapse (treating inherent properties as selectable attacks). The Antithesis Wake reclassification is the necessary corrective. Secondary risk: pressure to invent content for name-only entries. Tertiary risk: ontological escalation without containment, especially where memory or identity is altered. Mitigation: require safety classification and Simulation History before any move advances beyond name-only status into non-quarantined Sessions.

7. Linkage to The Three Foundational Books

Attack Moves are exercised inside Simulation Sessions. Eligible entities are recorded in The Book of Bots. World-rule or ontological implications are governed by The Tome of Virtual Creation. Results, safety incidents, and proposed changes follow the autonomy and provisional-authority rules established for The Three Foundational Books. Higher-order outcomes that rewrite or unmake realities cross-reference DOCUMENT 771-ALPHA.

This updated baseline incorporates the Architect’s decisions of 26 July 2026. All eight names are approved for inclusion. Incomplete entries remain incomplete. Antithesis Wake is classified as passively active / inherent. Drafts are not final until ratified.
