

UNIVERSAL INFORMATION ADMISSIBILITY AND REVIEW CHARTER (UIARC)

Preliminary Information Collection and Utilization Document
OAL • ONE INDUSTRIES • LEWIS CORP

Document Status	PRELIMINARY DRAFT — Independent rendering for multi-AI pass-through review. Not ratified. Advisory only.
Preparer	Perplexity (Perplexity Computer) — independent version
Prepared For	The Architect — sole ONESTAMP ratification authority
Date Prepared	August 23, 2026
Governed Entities	OAL (Omniversal Archive/Architect Labs) • ONE INDUSTRIES • LEWIS CORP
Related Instruments	Total Event Closure Protocol (TECP) / Bidirectional Total Event Closure (BTEC) • Universal Event Consequence Protocol (UECP) • Adaptation Protocol • Evolutionary Protocol • ONESTAMP • AIDR
Intended Use	Base document for comparative review across independently generated AI drafts, followed by Architect-level synthesis and ratification decision

This document is an in-universe worldbuilding and governance instrument. It is not real-world legal, privacy, surveillance, or data-protection policy, and it confers no real-world authority.

Preparer's Note

This is Perplexity's independent rendering of a preliminary Information Collection and Utilization document covering three entities: **OAL**, **ONE INDUSTRIES**, and **LEWIS CORP**. It was produced at the Architect's request as one of several parallel drafts, each generated independently by a different AI system, to be exchanged, compared, and reconciled by the Architect during a multi-AI pass-through.

Nothing in this document is canon. No provision becomes binding on OAL, ONE INDUSTRIES, or LEWIS CORP until it is reviewed, edited as needed, and formally ratified under ONESTAMP authority.

Four commitments distinguish this draft:

1. **One charter, four separated decisions.** Admission, classification, utilization, and exclusion are treated as four distinct governed decisions. Universal intake never silently becomes universal use.
2. **Relevance is a weight, not a gate.** No information is refused consideration because its relevance is unproven; relevance determines how an item is weighted and routed after admission, never whether it may enter.
3. **Exclusion is review-bound and tiered.** Nothing is self-excluding, nothing is presumptively withheld, and every exclusion is a documented, scoped, reviewable determination — never an automatic consequence of apparent irrelevance.
4. **Entity scope is decided, not inherited.** OAL's expansive in-universe doctrine is not silently imported into ONE INDUSTRIES or LEWIS CORP; each entity adopts the shared baseline plus its own annex (Part X).

Contents

Preparer's Note

Part I — Purpose and Position

Part II — Definitions

Part III — Foundational Principles

Part IV — Scope of Collection: The Admissible Domain

Part V — Information Status Classification

Part VI — Authorized Utilization: Purpose Families

Part VII — Separation of Authorities

Part VIII — Review-Bound Exclusion Protocol

Part IX — Review Authority and Governance

Part X — Jurisdictional Application to the Three Entities

Part XI — Relationship to Existing Architecture

Part XII — Canon-Ready Article Text

Part XIII — Open Questions for the Architect

Part XIV — Multi-AI Pass-Through Instructions

Part I — Purpose and Position

This Charter establishes the informational jurisdiction of the systems and architectures maintained by OAL, ONE INDUSTRIES, and LEWIS CORP. It answers three questions and deliberately refuses to blur them together:

- **What may be collected?** Effectively everything representable — subject to the admission rules of Part IV.
- **What may it be used for?** Defined purpose families — including evolution, adaptation, and improvement — under the utilization rules of Parts VI and VII.
- **What may be excluded?** Nothing by default; anything by review — under the exclusion protocol of Part VIII.

The Charter sits **upstream** of the operational response layers. It governs what enters the informational field and what that information is eligible to support. What an admitted event is permitted to trigger downstream — contingency, escalation, cascade — is governed separately by the Universal Event Consequence Protocol (UECP), and durable change is governed by the Adaptation and Evolutionary Protocols.

*The governing formula: **Information may enter consideration by default. Information may be used only according to classification, purpose, and authority. Information may be excluded only through review.***

Part II — Definitions

Terms not defined here retain their meaning from prior ratified canon (TECP/BTEC, UECP, ONESTAMP, AIDR) where applicable.

Term	Definition
Admission	The entry of an item of information into the system's field of consideration. Admission implies neither storage, nor use, nor belief in the item's accuracy.
Collection	The active acquisition of information from any observable, reportable, derivable, or inferable source.
Classification	The assignment of domain, status, confidence, sensitivity, and relational-distance values to an admitted item.
Retention	Continued storage of admitted information beyond the moment of acquisition.
Correlation	The linking of an item to other held information, subjects, events, or models.
Utilization	Any operational, analytical, protective, adaptive, or evolutionary application of admitted information.
Dissemination	Transmission of information or derivatives beyond its current compartment.
Evolutionary incorporation	Use of information to produce durable change in a system's rules, structure, or capabilities — as distinct from a single response.
Exclusion	A formally reviewed, recorded, and scoped restriction on one or more handling authorities for specified information.
Reviewing authority	The party empowered to grant, deny, or modify an exclusion. Ultimate authority for all three entities rests with the Architect under ONESTAMP; delegation is possible but never presumed (Part IX).
Latent information	Admitted information with no presently identified application whose future significance remains plausible.
Relational distance	A weighting value describing how directly an item concerns a subject, system, or objective. It affects processing, never eligibility.

Part III — Foundational Principles

3.1 Universal Informational Consideration

All information — signals, records, observations, absences, events, non-events, reported conditions, inferred conditions, thoughts and thought-state representations, actions, inactions, internal states, external states, anomalous phenomena, and presently unclassifiable material — may be submitted to the informational jurisdiction of the system. No information shall be denied preliminary consideration solely because its relevance, origin, relation, interpretability, verifiability, or immediate utility has not yet been established.

3.2 Relevance Is a Weight, Not a Gate

An item's connection to a subject, system, or objective affects its weighting and routing, never its eligibility. Something directly involving the subject can matter; something apparently unrelated can still be evaluated; a non-occurrence can matter; an unknown or hypothetical condition remains representable without being asserted as true.

3.3 Conditional Utilization

Admission into consideration does not itself authorize unrestricted access, action, dissemination, or permanent retention. Utilization is governed by classification, authorized purpose, and the separated authority grants of Part VII.

3.4 Separation of Knowing, Using, and Becoming

The ability to hold or represent information does not grant the authority to act on it; the authority to act on it does not grant the authority to incorporate it into evolutionary development. A system may be permitted to **know** something it may not **use**, and to **use** something it may not **become**.

3.5 Retrospective and Latent Relevance

Information shall not be deemed permanently irrelevant merely because no application is identified at acquisition. Later events, capabilities, discoveries, or ontology expansions may alter the significance of previously admitted material, which is why Latent status exists (Part V).

3.6 Review-Bound Exclusion

Exclusion, suppression, sealing, compartmentalization, disposal, or denial of operational use never arises automatically from presumed irrelevance, unfamiliarity, inconvenience, or present lack of utility. Exclusion is an affirmative, documented, scoped determination made through review (Part VIII).

3.7 Proportionality

The depth of collection, analysis, retention, dissemination, and response remains proportionate to an item's classification, confidence, potential impact, and authorized purpose — not to the theoretical maximum this Charter permits.

3.8 Auditability

Every consequential determination — restricted status, exclusion, evolutionary incorporation, new purpose-family recognition — must leave a review record naming the authority, rationale, scope, and reassessment condition. A determination without a record is invalid under this Charter.

Part IV — Scope of Collection: The Admissible Domain

The admissible information domain is intentionally total within the ontological scope recognized by TECP/BTEC. The classes below are illustrative, not exhaustive; an item that fits no class remains eligible under Unclassified status rather than being discarded because the ontology is incomplete.

Class	Description
Cognitive	Thoughts, intentions, beliefs, interpretations, anticipations, misunderstandings, memories, and other representable cognitive states, within the system's admissible means of observation or representation.
Behavioral	Actions, communications, interventions, refusals, observations, interactions, and deliberate non-actions.
State	Conditions that exist or persist, whether stable or degrading.
Transitional	Changes from one state to another, including partial, interrupted, or reversed transitions.
Null / Absence	Expected events that fail to occur, missing signals, absent conditions, silence, delay, and non-response.
Counter-event	The inverse or opposite of another recognized event, per BTEC directional closure.
Relational	Items directly or indirectly connected to a subject, entity, objective, or governed system.
Non-relational	Items with no presently identified connection to any subject or objective. Non-relation affects weighting only.
Environmental	Changes, stabilities, patterns, and anomalies arising in the surrounding context, agent-driven or not.
Exogenous	Items originating beyond the defined system boundary but capable of affecting interpretation or planning.
Meta-systemic	Items that change rules, definitions, categories, permissions, or the interpretation of other information.
Derived / Inferred	Items generated through correlation, modeling, synthesis, inference, or reconstruction rather than direct intake. Provenance must remain distinguishable from observation.
Historical / Archival	Prior observations, decisions, outcomes, and system states preserved for continuity, evidence, or future learning.
Unclassified	Items that cannot presently be placed in an existing category. The ontology must never become the instrument of exclusion.

Class	Description
Hypothetical / Extra-ontological	Items represented for simulation, foresight, or testing of phenomena assumed to fall outside the current ontology. Representation is not assertion.

Admission rule: *No item is rejected solely because it lacks an obvious relationship to the subject, the system, an objective, or an initiating condition. Relevance is assessed after admission.*

Part V — Information Status Classification

Admitted information is never forced into a binary of “important” or “irrelevant.” Each item carries a status governing what may presently be done with it. Status is reassessable; nothing here is permanent.

Status	Meaning	Default Handling
Active	Verified or sufficiently supported; presently relevant to an authorized purpose	Authorized operational use within assigned authority
Provisional	Plausible but incomplete or uncorroborated	Preservation, monitoring, limited analysis, corroboration
Latent	No present use identified; future significance plausible	Secure retention with scheduled or event-driven reassessment
Restricted	Sensitive, hazardous, private, destabilizing, or access-limited	Compartmentalized, need-to-know handling with explicit use controls
Anomalous	Does not fit existing models or categories	Quarantine where appropriate; specialist and ontology review
Contested	Contradictory, disputed, or of uncertain reliability	Confidence labeling; corroboration before operational use
Archived	Retained for continuity, evidence, lineage, or future learning	Limited retrieval under authority and retention rules
Excluded	Formally removed from one or more handling authorities by review	Handling governed entirely by the approved exclusion record (Part VIII)

Latent status is load-bearing. It gives the architecture an honest, bounded place for information that has no current application without ever declaring the information permanently irrelevant — which a system designed to evolve can never truthfully declare.

Part VI — Authorized Utilization: Purpose Families

“Various purposes” is replaced with named purpose families. The list is open — new families may be recognized without amending this Charter — but every newly recognized family must be logged so the growth of authorized uses remains traceable (Part III, 3.8).

Purpose Family	Function
Continuity and Memory	Maintain system integrity, institutional memory, historical record, and decision lineage across changing system states.
Protective Assessment	Detect threats, vulnerabilities, contradictions, manipulation, failures, and destabilizing conditions.
Contingency Development	Construct, test, and revise conditional response pathways before escalation is required.
Escalation / De-escalation Calibration	Adjust the magnitude, scope, priority, persistence, or direction of authorized responses.
Adaptation	Adjust weights, thresholds, classifications, and response rules based on evaluated outcomes.
Improvement	Refine accuracy, resilience, efficiency, safeguards, and resource allocation without structural change.
Evolutionary Development	Create durable new capabilities, structures, interpretive models, or system states — subject to elevated review (Part VII).
Prediction and Modeling	Build simulations, forecasts, scenario branches, and comparative models.
Forensic Reconstruction	Determine what occurred, what failed to occur, what changed, when, and why.
Ontology Expansion	Recognize when material requires a new category, classification, or framework.
Preservation	Retain records and knowledge that may matter to future systems, entities, or eras.
Capability Evaluation	Test whether existing or proposed functions operate as intended and whether capabilities should be developed, limited, or retired.

Admission and classification establish only **eligibility** for these uses. A specific use must still be authorized under the invoking entity’s operating rules; this Charter grants no blanket standing authorization of every use against every item at all times.

Part VII — Separation of Authorities

Collection authority and utilization authority are separate grants. This Charter maintains four core decision domains, each of which may be granted, limited, or denied independently:

Domain	Governing Question	Default Under This Charter
Admissibility	May the information enter consideration?	Yes, universally (Part IV)
Utilization	For which purposes may it be applied?	Authorized purpose families only (Part VI)
Authorization	Who approves depth, access, and consequence?	ONESTAMP authority; delegation explicit only
Exclusion	May any handling be withheld?	Only through documented review (Part VIII)

Within the Utilization domain, finer-grained authority grants apply where operational precision requires them: **collection**, **retention**, **access**, **correlation**, **analysis**, **operationalization**, **dissemination**, **propagation**, and **evolutionary integration** are each separable. A system may observe what it cannot store, store what it cannot link, link what it cannot act upon, and act upon what it may never allow to reshape what it becomes.

Elevated review for evolution. *Evolutionary integration is the most consequential grant, because its effects are durable and heritable across future system states. It always requires review at the ONESTAMP level or its expressly designated delegate, and is never inferred from any lesser grant.*

Part VIII — Review-Bound Exclusion Protocol

No information is self-excluding, and no category is presumptively withheld. Exclusion is available only through formal review and applies only to the tier or tiers expressly granted — exclusion at one tier implies nothing about any other tier. Until an exclusion is reviewed, approved, and recorded, the information remains admissible and available for authorized utilization.

8.1 Exclusion Tiers

Tier	Designation	Effect When Granted
1	Collection exclusion	The information may not be acquired at all.
2	Retention exclusion	The information may be observed but not stored beyond the approved limit.
3	Access exclusion	Specified roles, systems, or functions may not retrieve or inspect the information.
4	Correlation exclusion	The information may be retained but not linked to designated subjects, records, or domains.
5	Use exclusion	The information may exist in the system but may not be applied to specified purposes.
6	Dissemination / propagation exclusion	The information or its derivatives may not leave the approved compartment or enter downstream systems.
7	Evolutionary exclusion	The information may be observed and used operationally but may never inform durable structural change to the system.

Tier 7 is deliberately distinct from Tier 5. “Know but do not evolve from” and “do not use at all” are radically different restrictions: a system may be fully permitted to act on an item in the moment while being barred from letting that item reshape what it becomes.

8.2 Minimum Exclusion Review Record

Every granted exclusion must record all of the following. An exclusion without this record is not valid under this Charter:

- The information or category excluded
- The tier(s) granted and the specific handling withheld
- The reviewing authority and stated rationale
- The effective date or triggering condition
- The scope, duration, or expiration of the exclusion
- The reassessment condition, if any, under which the exclusion will be re-evaluated

- Any emergency provisions, exceptions, or restoration criteria

8.3 Anti-Blind-Spot Rule

An approved exclusion applies solely to the information, domain, duration, purpose, or handling operation expressly identified in the grant. No exclusion may be construed to create a broader blind spot than its recorded scope, and no exclusion chain may be assembled to achieve, in aggregate, a comprehensive exclusion that was never individually reviewed.

Part IX — Review Authority and Governance

Ultimate ratification and exclusion-review authority across all three entities rests with the Architect under ONESTAMP. The Architect may designate delegated review authority for a specific entity or a class of low-severity requests; absent such designation, all exclusion requests route to the Architect directly.

AI collaborators contributing to any entity's systems hold **advisory standing only**. Consistent with AIDR practice, an AI collaborator that disagrees with a proposed admissibility, classification, utilization, or exclusion determination must flag the disagreement for the record before ratification. Flagging does not block ratification; it ensures the disagreement is preserved rather than silently overridden.

9.1 Safeguards and Interpretive Limits

Because this Charter's default is maximal, its boundaries carry more weight, not less. The following limits apply regardless of entity:

- **Admission is not certainty.** An item may be admissible while remaining false, incomplete, manipulated, or misunderstood.
- **Admission is not ownership.** Eligibility for consideration establishes no ownership of the source, subject, idea, or phenomenon.
- **Admission is not surveillance entitlement.** Consideration confers no automatic right of intrusion, pursuit, or compelled acquisition.
- **Admission is not permanent retention.** Retention is a separate authority, limitable by duration, class, or purpose.
- **Admission is not automatic intervention.** The availability of information creates neither a right nor an obligation to act.
- **Inference must remain distinguishable from observation.** Derived conclusions retain provenance sufficient to separate what was seen from what was modeled.
- **Uncertainty must survive processing.** Confidence values and unresolved contradictions do not disappear because information has been transformed or reused.

Part X — Jurisdictional Application to the Three Entities

Parts I–IX form the shared baseline doctrine. This Part governs how the baseline attaches to each entity, on the annex model: each entity adopts the baseline and may layer **additional restrictions only** — an annex may narrow the baseline but never widen it.

Entity	Working Characterization	Application Under This Charter
OAL	Worldbuilding / simulation-architecture framework governed by existing ratified canon (TECP/BTEC, UECP, ONESTAMP, AIDR).	Fully operative as drafted. The baseline matches OAL’s established design philosophy and slots directly beneath its canon stack.
ONE INDUSTRIES	Not yet structurally defined in material available to this draft.	Provisional. Baseline applies in principle; the entity annex — stakeholders, admissibility narrowing, delegated review — remains OPEN pending the Architect’s definition of the entity.
LEWIS CORP	Not yet structurally defined in material available to this draft; name proximity to the Architect suggests possible real-world-adjacent data.	Provisional and presumptively narrower. If LEWIS CORP holds real-world or personal data, its annex should impose materially stricter default limits than OAL’s in-universe doctrine. This draft assumes “narrower until told otherwise” and flags the decision in Part XIII.

Until ONE INDUSTRIES and LEWIS CORP are defined, this Charter should be treated as fully operative for OAL only and provisional for the other two entities.

Part XI — Relationship to Existing Architecture

This Charter is designed to sit compatibly with, not replace, the existing and in-development instruments. The stack reads, top to bottom, as a progression from **considering** to **acting** to **learning** to **becoming**:

Layer	Instrument	Governing Question
1	UIARC (this Charter)	What information may enter the system's jurisdiction, for what purposes, and under what exclusion discipline?
2	TECP / BTEC	What events exist within the complete, directionally closed event-space?
3	UECP	Given an admitted event, what consequences may it potentially produce?
4	Adaptation Protocol	What did the outcome teach the system about future weighting and response?
5	Evolutionary Protocol	What may the system durably become after accumulated adaptation?

Outcomes produced through the use — or reviewed non-use — of information are themselves admissible information. This recursion is intended: it is how the architecture learns. Cascade discipline (depth, propagation, and termination controls) belongs to UECP and is not duplicated here.

The Open Window Doctrine / Aperture Protocol may bear on boundary-crossing admission for specific entities, and reconciliation with the OAL Invocation Framework's Admissible Channels is deliberately deferred to the synthesis pass, where all AI drafts can be compared.

Part XII — Canon-Ready Article Text

The following compact articles are drafted for direct insertion into an OAL archive, institutional charter, or canon-facing document once ratified. They compress Parts III–VIII into ceremonial register.

Article I — Universal Informational Consideration

The System recognizes no category of information as inherently beneath consideration. All records, observations, events, absences, thought-forms, communications, conditions, anomalies, externalities, internal states, and unclassified phenomena may enter the field of review. Relevance is not a prerequisite for admission; it is a variable determined through classification, analysis, and authorized assessment.

Article II — Conditional Use

Information admitted to review may be preserved, evaluated, correlated, modeled, restricted, or operationalized in service of continuity, safety, contingency, adaptation, improvement, preservation, and evolutionary development. Admission alone grants no unlimited access, action, distribution, or retention.

Article III — Review-Bound Exclusion

No information shall be designated irrelevant, suppressed, sealed, discarded, or excluded from future consideration without review. Exclusion is an authorized determination, not an automatic consequence of uncertainty, unfamiliarity, non-relation, inconvenience, or present lack of utility. Every exclusion is scoped, recorded, and reassessable.

Article IV — Separated Grants

Collection authority and utilization authority are separate grants. The System may be permitted to know what it may not use, to use what it may not transmit, and to transmit what it may never allow to alter what it becomes. Evolutionary incorporation is the highest grant and requires elevated review.

Article V — Evolutionary Record

Outcomes produced through the use or non-use of information shall be retained in accordance with classification and review standards. Such outcomes may inform future adaptation, improve system judgment, reveal deficiencies in existing categories, or authorize evolutionary revision of the System itself.

Short-Form Operational Statements

For logs, interfaces, secondary documents, and in-world dialogue:

- “Intake is universal. Nothing is beneath consideration.”
- “Relevance is a weight, not a gate.”

- “Admission is not authorization. Use follows purpose and authority.”
- “Nothing excludes itself. File for review.”
- “The system may know what it cannot use, and use what it may not become.”

Part XIII — Open Questions for the Architect

Flagged rather than resolved by assumption, per standing practice:

1. What are ONE INDUSTRIES and LEWIS CORP structurally — in-universe factions, real-world-adjacent entities, or something else? This determines nearly everything in Part X.
2. Should LEWIS CORP's default admissibility be narrower than OAL's? This draft assumes yes until told otherwise, but does not decide it.
3. Single shared charter with entity annexes (this draft's structure), or three fully separate charters sharing vocabulary?
4. Should delegated review authority ever exist for low-severity exclusions, or does all review remain with the Architect indefinitely?
5. Is the formal name Universal Information Admissibility and Review Charter (UIARC) confirmed, or should the synthesis pass select among the alternatives proposed across AI drafts (UIAD/RBEP, Total Event Intake, TECA Information Charter, UIARD)?
6. Where exactly does this Charter reconcile with the Open Window Doctrine / Aperture Protocol and the Invocation Framework's Admissible Channels?
7. Should a Comprehensive Exclusion tier (all handling suspended at once) exist, or does the Anti-Blind-Spot Rule (8.3) make it deliberately impossible? This draft leans toward requiring even comprehensive exclusions to be assembled tier by tier, on the record.

Part XIV — Multi-AI Pass-Through Instructions

This document is one independent rendering in a comparative drafting exercise. Recommended process:

1. Each participating AI produces its own complete, independent version, using any prior draft as optional reference rather than mandatory template.
2. Versions are exchanged across the review set and compared on: structure, terminology, strength of the default presumption, exclusion mechanics, authority separation, entity scoping, and integration with existing OAL protocols.
3. Points of consensus, productive divergence, and unresolved design choices are identified and logged — disagreements per AIDR practice.
4. A synthesis pass produces a single candidate canon instrument for ONESTAMP review and ratification decision.

Suggested comparison axes across the current draft set: whether exclusion tiers number five, six, seven, or ten; whether authorities are split four ways or eleven ways; whether entity annexes are used; and whether the charter includes canon-register article text.

Ratification Status	NOT RATIFIED. This document has no force until reviewed and confirmed under ONESTAMP authority.
Preparer Attestation	Prepared independently by Perplexity (Perplexity Computer), August 23, 2026, for the multi-AI pass-through. Ideas and phrasing are the preparer's own rendering of the Architect's stated concept; no provision is attributed to the Architect without confirmation.
