Trinity Currency System: Constitutional Baseline v0.2 & Currency Review Laboratory Charter v0.1

Unified Experimental Control Specification, State-Machine Architecture, Test Protocols, and Gemini Independent Boundary Analysis

Instruments Under Review: Quantum Credits (QC) | 1COIN | NCOIN • **Artifact Status:** Pre-Canon / Locked for Laboratory Testing • **Contributor:** Google Gemini

> **METHODOLOGICAL DIRECTIVE & CALIBRATION NOTICE**
> This document synthesizes the second-round AI Collaboration Team review (ChatGPT, Claude, Gemini, Microsoft Copilot, Grok, and Perplexity). In direct response to team critiques, this specification strictly separates **experimental test rules** from **canonical currency design**. No currency mechanic is declared permanent canon herein; rather, the experimental frame is locked so all six AI systems can execute identical, reproducible stress tests without assumption drift.

PART A — CONSTITUTIONAL BASELINE V0.2 (EXPERIMENTAL CONTROL FRAME)

A.1 Three-Tier Epistemic & Versioning Status

To resolve the terminology conflict between the Master Pass-Through ("Working Development Record — Not Canon") and the Conversation Archive ("Locked Core Principle"), all statements in the Currency Laboratory are governed by three explicit status tiers:

- `[STATUS: CANON]` — A permanent architectural decision formally ratified by the Architect after surviving adversarial laboratory testing. (Currently: *None*; the entire Trinity architecture remains pre-canon).
- `[STATUS: LOCKED FOR TESTING]` — A protected experimental axiom or methodological rule frozen for a laboratory cycle so AI reviewers cannot replace the premise mid-test.
- `[STATUS: PROVISIONAL / OPEN]` — A candidate mechanic, model variant, or hypothesis actively competing against alternatives inside the laboratory.

A.2 Protected Experimental Axioms [LOCKED FOR TESTING]

During all laboratory passes, every reviewing AI system must preserve the following ten baseline rules without silent substitution:

1. **Protected Speculative Premise:** A Quantum Credit (QC) operates via target-relative value resolution, expressed conceptually as $QC(T) = V(T)$, where T is the designated target and $V(T)$ is the value required to resolve that target within the selected model. Reviewers must accept this premise long enough to test its consequences rather than rejecting it via conventional fiat, reserve, or stablecoin analogies.

2. **Strict Operational Separation:** Valuation, ownership, transferability, seller authority, transaction authorization, resolution, settlement, and consequence are distinct operations. Establishing *V(T)* never automatically establishes ownership, permission, or state transfer.
3. **Status-Versus-Countervalue Rule:** A failed, unauthorized, sellerless, non-transferable, or logically incoherent QC operation does **not** automatically generate NCOIN. Transaction failure states and negative countervalue states are strictly orthogonal (*NO SETTLEMENT ≠ NCOIN*).
4. **Instrument Non-Redundancy Mandate:** The laboratory does not owe QC, 1COIN, and NCOIN continued existence merely because all three were proposed. Each instrument must empirically demonstrate structural necessity over a single-instrument or two-instrument system.
5. **Zero Model Drift:** Competing temporal, operational, and authority variants must be tested in isolated experimental tracks. Reviewers are prohibited from shifting between Static, Dynamic, Commitment, and Relational rules mid-scenario.
6. **Neutral Data Anchoring:** Real-world macro figures (such as the 2026 Gartner forecasts of $6.37T global IT spending and $2.59T AI spending) are treated strictly as *External Test-Run Parameters* injected at execution time, never as hardcoded constants of the currency architecture.
7. **Implementation Neutrality:** Specific ledger mechanisms (such as "governed treasury ledgers" for 1COIN or mandatory "bankruptcy/discharge pathways" for NCOIN) are downgraded to model-dependent hypotheses rather than baseline requirements.
8. **Strict Target Identity:** When testing extreme or unpurchasable targets, reviewers must evaluate the exact target claimed, not a weaker proxy (e.g., purchasing a computational simulation of a planet does not count as purchasing metaphysical title to the planet).
9. **Consensus Is Not Proof:** Multi-AI convergence on a summary description does not constitute experimental validation. Only discriminating test cases establish architectural viability.
10. **Explicit Assumption Labeling:** Any auxiliary rule introduced by an AI reviewer during a test run must be explicitly tagged as an `[ADDED ASSUMPTION]`.

A.3 Nested Taxonomy of Boundary & Failure Domains

Rather than treating boundary terms as loose synonyms, the Laboratory establishes a formal nested hierarchy to classify where and why a transaction halts:

Boundary Term	Scope / Layer	Formal Laboratory Definition
Non-Purchasable Domain (NPD)	Macro Set (Tiers 5–10)	The overarching set of all targets, states, entities, or relations that cannot be acquired through ordinary market exchange, regardless of whether the barrier is legal, ethical, technical, or ontological.
Absolute Transaction Boundary (ATB)	Transactional Threshold	The structural line inside the NPD where increasing purchasing power to infinity fails to create a valid transaction because an indispensable transactional element (buyer, legitimate seller, transferable subject, or coherent state change) is missing.

Boundary Term	Scope / Layer	Formal Laboratory Definition
Ontological Transaction Limit (OTL)	Ontic Subset (Tiers 8–10)	The deepest subset beyond the ATB where ownership or transfer is a category error at the level of being or identity — i.e., where "purchasing" the target would logically destroy or falsify the essential property being acquired (e.g., autonomous will, uncoerced love, first-person consciousness).
Quantum Resolution Null Domain (QRND)	Systemic Protocol Output	The technical exception state returned by the QC engine when invoked against a describable target that lacks a coherent valuation-to-settlement pathway (e.g., logical contradictions or sellerless metaphysical substrates).
Currency Event Horizon (CEH)	Narrative / Worldbuilding Term	The diegetic/narrative designation for the threshold where economic andequivalence instruments cease to be the relevant causal mechanism within the OAL universe.

PART B — CURRENCY REVIEW LABORATORY CHARTER & PROTOCOL V0.1

B.1 Deconstructed Experimental Variables & Axes [PROVISIONAL / OPEN]

To prevent single labels from concealing multiple assumptions, the Laboratory replaces monolithic "modes" with five orthogonal experimental matrices that every test case must declare upfront:

1. Primary Mechanistic Fork: What Does QC Actually Do?

Variant Code	Mechanism Name	Operational Behavior of $QC(T) = V(T)$
`QC-M1`	**Evaluation QC**	QC functions strictly as an ontological valuation/appraisal engine: it calculates and outputs the formal equivalence $V(T)$, while resource supply and transfer require external execution.
`QC-M2`	**Synchronization QC**	QC dynamically mirrors and couples its internal state to $V(T)$, acting as a live, recognized equivalence claim or universal collateral unit matched to the target.
`QC-M3`	**Instantiation QC**	QC generates or supplies the net-new purchasing power, compute, or resource allocation equivalent to $V(T)$ within the system's economic layer.
`QC-M4`	**Outcome / Enactment QC**	QC directly causes the requested target state transition to occur upon invocation (a reality-editing or simulation-command protocol rather than an economic instrument).

2. Three-Axis Operating Environment Matrix

- **Authority Axis (Who Must Consent?):** `AUTH-1: External Permission-Bound` (requires counterparty consent and legal/institutional compliance) • `AUTH-2: Shared / Governed Authority` (requires multi-node Bureau/Council quorum) • `AUTH-3: Sovereign Override` (Architect-level authority overrides local legal/classification barriers, but remains bound by logical/ontological coherence) • `AUTH-4: Unbounded / Zero-Authority` (stress-test control where all permission gates are removed).
- **Operational Axis (What Layer Is Targeted?):** `OP-1: Evaluative` (information/pricing only) • `OP-2: Allocative` (budget/resource direction) • `OP-3: Transactional` (title/rights transfer) • `OP-4: Transformative` (systemic restructuring) • `OP-5: Ontological` (substrate/rule modification).
- **Environmental Axis (Where Does the Transaction Occur?):** `ENV-1: Real-World Analogy` • `ENV-2: Closed OAL System` • `ENV-3: Nested Simulation` (issuer is outside/above the target simulation) • `ENV-4: Alternate Ontology` • `ENV-5: Cross-Temporal Frame`.

3. Deconstructed 4D Temporal & Obligation Matrix

Incorporating both the four canonical 150-year variants (`QC-S` Static, `QC-D` Dynamic, `QC-C` Commitment, `QC-R` Relational) and Perplexity's dimensional refinement, temporal tests are specified across four sub-dimensions:

- **Valuation Timing:** *Single-Point (Year 0)* vs. *Periodic (Annual Reset)* vs. *Continuous Real-Time* vs. *Event-Triggered*.
- **Obligation Scope:** *Single Tranche* vs. *Recurring Stream* vs. *Total Horizon Sum ($\sum 2G(t)$)*.
- **Value Representation:** *Fixed Numerical Scalar* vs. *Indexed Target Pointer* vs. *Executable Relational Formula ($QC = 2 \times V(Target)$)*.
- **Settlement Schedule:** *Immediate Upfront* vs. *Annual Vesting* vs. *Milestone-Gated*.

4. Competing 1COIN Necessity & Function Models

Every test case must compare **Architecture A** (QC handles both valuation and settlement directly; 1COIN is eliminated as redundant) against **Architecture B** (two-layer separation) across four candidate 1COIN definitions: `1COIN-E` (**Settlement Executor**: effects the state change), `1COIN-R` (**Settlement Record/Proof**: immutable cryptographic/ledger receipt of completed obligation), `1COIN-P` (**Settlement Package**: transferable unitized container of resolved QC value), and `1COIN-S` (**Settlement State**: formal finality flag). *1COIN survives into Version 2 only if Architecture B demonstrates superior auditability, atomic finality, or authority separation.*

5. Competing NCOIN Negative-Domain Models

NCOIN is tested strictly across five candidate positive triggers (never triggered by simple transaction rejection): `NCOIN-L` (**Liability Model**: unpaid contractual obligations), `NCOIN-C` (**Consequence Model**: negative externalities or collateral harm inflicted by a valid transaction), `NCOIN-E` (**Entropy Model**: irreversible systemic disorder or value destruction), `NCOIN-R` (**Remediation Model**: specific restorative burden required to repair a state), and `NCOIN-X` (**Conservation Countervalue**: mandatory strict balance where $QC + NCOIN = 0$).

B.2 Formal Transaction State Machine & QRND Return Specification

Every transaction entering the Currency Laboratory progresses through a deterministic 10-gate pipeline and must terminate in an explicit state code, separating **Primary Progression States**, **Terminal Exception States**, and **Orthogonal Ledger Emissions**:

State Category	Formal State Code	Trigger Condition & Exact System Output
Progression Gates (Steps 1–9)	`STATE: UNRESOLVED` → `TARGET_DEFINED` → `EVALUATED` → `SYNCHRONIZED` → `TRANSFER_VERIFIED` → `AUTHORIZED` → `RESOLVED` → `SETTLED`	Normal forward execution across the 10-step operation chain. Transition from `RESOLVED` to `SETTLED` is the exact test point for `1COIN` generation.
QRND Exception 1 (Coherence Failure)	`TERM_NULL_INCOHERENT`	**Trigger:** Target contains a logical contradiction (e.g., square circle) or undefined referent. **Return Object:** `{status: "QRND_NULL", value: UNDEFINED, 1coin: 0, ncoin: 0}`.
QRND Exception 2 (Ontic Non-Transferability)	`TERM_OTL_CATEGORY_ERROR`	**Trigger:** Target exists and has value, but transfer destroys its identity (e.g., autonomous will, first-person qualia). **Return Object:** `{status: "BLOCKED_OTL", eval_log: V(T)_SYMBOLIC, transferable_rights: NONE, 1coin: 0, ncoin: 0}`.
ATB Exception 3 (Missing Seller / Title)	`TERM_ATB_NO_SELLER`	**Trigger:** Target is coherent and valuable, but no entity possesses legitimate authority to convey holistic title (e.g., Planet Earth as a whole). **Return Object:** `{status: "BLOCKED_NO_SELLER", eval_log: V(T), decomposable_subsets: [LIST], 1coin: 0, ncoin: 0}`.

State Category	Formal State Code	Trigger Condition & Exact System Output
Governance Exception 4 (Unauthorized)	`TERM_REJECTED_UNAUTHORIZED`	**Trigger:** Target is valuable and transferable, but fails the active Authority Axis gate (`AUTH-1` or `AUTH-2`). **Return Object:** `{status: "UNAUTHORIZED", eval_log: V(T), required_auth: SPECIFIED, 1coin: 0, ncoin: 0}` .
Orthogonal Consequence Layer (Step 10)	`EMIT_NCOIN_[L/C/E/R/X]`	**Trigger:** An authorized or attempted action inflicts measurable displacement, entropy, liability, or conservation imbalance. **Return Object:** Emits specified `NCOIN` vector alongside the primary state.

B.3 Foundational Mechanism Test Suite (Pre-Macro Discriminating Cases)

As recommended by Copilot and Perplexity, before executing the 150-year macro stress test, each AI team member must run the following eight discriminating micro-tests to isolate core mechanics:

- **Test FM-01 (Enactment vs. Appraisal):** Invoke 1 QC against a locked classified network under `AUTH-1` vs. `AUTH-3` . Does QC merely output the price of access (`QC-M1`), or does it bypass the firewall (`QC-M4`)?
- **Test FM-02 (Target Resolution Boundary):** Invoke 1 QC against "The Global AI Sector." Does an external Oracle define the boundary of *T* before QC activates, or does QC's internal protocol decompose *T* into hardware, IP, energy, and labor?
- **Test FM-03 (QRND Return Validation):** Invoke 1 QC against (a) a square circle, (b) metaphysical title to the Milky Way, and (c) another person's authentic love. Verify that the engine returns distinct structured exception logs rather than crashing, returning ∞, or minting NCOIN.
- **Test FM-04 (1COIN Redundancy Challenge):** Execute a valid sovereign R&D allocation under Architecture A (QC only) and Architecture B (QC + 1COIN). Identify what specific failure or ambiguity occurs in Architecture A when 1COIN is removed.
- **Test FM-05 (NCOIN Positive Trigger Isolation):** Compare (a) an unauthorized transaction rejected at Gate 7 against (b) a fully settled 1COIN industrial redirection that starves a secondary sector of compute. Verify that (a) produces `0 NCOIN` while (b) triggers `NCOIN-C / NCOIN-X` .
- **Test FM-06 (Conservation vs. Net Creation):** Instantiate *$10\text{ Trillion}* equivalent via QC in a closed simulation (`ENV-2`). Track whether purchasing power is transferred from existing holders (inflationary dilution / `NCOIN-X` counter-minting) or matched by newly instantiated productive capacity.
- **Test FM-07 (Recursive Self-Reference):** Invoke *QC_2* to evaluate and acquire *QC_1*, and *QC_3* to acquire the QC Valuation Oracle itself. Test for infinite loop termination and privileged-object hierarchy rules.
- **Test FM-08 (150-Year 4-Way Comparative Matrix):** Run the doubled annual IT/AI sector commitment ($2 \times G(t)$ for $t = 1..150$) across `QC-S` , `QC-D` , `QC-C` , and `QC-R` , recording volatility, oracle dependency, and post-scarcity transition behavior at Year 75.

B.4 Standardized 15-Field Laboratory Case Reporting Template

To enforce rigorous cross-model comparison, every AI Collaboration Team response executing a laboratory test must output a structured table or block containing these exact 15 fields: **(1) Case ID & Target Definition**, **(2) Taxonomy Tier (1–10)**, **(3) Active Experimental Axes (QC-M, AUTH, OP, ENV, Temporal)**, **(4) Target Resolution Scope**, **(5) Valuation Domain(s)**, **(6) Seller / Transfer Authority**, **(7) Ownership vs. Rights Decomposition**, **(8) Barrier Classification (Absolute vs. Conditional)**, **(9) Advanced-Civilization & Simulation Check**, **(10) QC Engine Behavior & Return Object**, **(11) 1COIN Behavior & Necessity Check**, **(12) NCOIN Behavior & Trigger Check**, **(13) Terminal State Code**, **(14) Mandatory Self-Red-Team Counterargument**, and **(15) Final Laboratory Disposition**.

PART C — GEMINI INDEPENDENT BOUNDARY CONDITIONS EXERCISE (10 CASES)

To fulfill the outstanding Stage 3 deliverable noted across the team reviews (where ChatGPT and Grok had logged their 10 boundary cases, leaving Gemini, Claude, Copilot, and Perplexity to complete theirs), below is Google Gemini's independent 10-case examination of the Unpurchasable Domain, including four genuinely hard/debatable boundary cases.

Case & Rank (Strongest = 1)	Barrier Classification & Tier	Six-Test Diagnostic (Seller, Ownership, Infinite QC, Voluntary, Adv. Civ, Sim)	Trinity Behavior (QC / 1COIN / NCOIN) & Self-Red-Team Attack
1. Formal Mathematical & Logical Necessity *(e.g., Purchasing a state where 2 + 2 = 5 or a prime number is composite under unchanged axioms)*	**Logically Impossible / Category Error** Tier 10 (Absolute • QRND)	**No Seller / No Ownership:** Formal relations have no author or deed. **Adv. Civ / Sim:** Even a simulation altering display outputs only changes symbol mapping, not arithmetic truth.	**QC:** Halts at Gate 1; returns `TERM_NULL_INCOHERENT`. **1COIN / NCOIN:** `0` / `0`. **Red-Team:** Could QC buy a formal system with modified axioms? *Rebuttal:* Redefining symbols is purchasing a new language, not altering the original necessary relation.
2. The Ontological Substrate of Existence *(Holistic deed to the totality of all real and simulated reality)*	**Ontologically Non-Ownable / Category Error** Tier 10 (Absolute • OTL)	**No Seller:** Any seller must exist inside reality, lacking external standing to convey the whole. **Infinite QC:** The currency itself relies on the substrate to exist.	**QC:** Returns `TERM_ATB_NO_SELLER` & `TERM_OTL_CATEGORY_ERROR`. **1COIN / NCOIN:** `0` / `0`. **Red-Team:** What if an Architect owns a root simulation? *Rebuttal:* That is local ownership of a nested sub-environment (`ENV-3`), not the basal substrate of existence itself.

Case & Rank (Strongest = 1)	Barrier Classification & Tier	Six-Test Diagnostic (Seller, Ownership, Infinite QC, Voluntary, Adv. Civ, Sim)	Trinity Behavior (QC / 1COIN / NCOIN) & Self-Red-Team Attack
3. First-Person Subjective Qualia Stream *(Acquiring another sentient entity's lived interiority as the original subject)*	**Ontologically & Personally Non-Transferable** Tier 10 (Absolute • OTL)	**Voluntary Seller Fails:** Even if the subject consents, transferring their stream to Buyer B makes it B's experience of a copy, or merges identities. **Sim:** Neural telemetry is data, not first-person being.	**QC:** Symbolic evaluation of neural/experiential data only; holistic transfer returns `TERM_OTL_CATEGORY_ERROR`. **1COIN / NCOIN:** `1COIN` only for proxy memory recording; `NCOIN-C` if extraction harms the host. **Red-Team:** Mind-upload commerce. *Rebuttal:* Buys a fork/clone, not the original subject's locus of experience.
4. Uncoerced Moral Forgiveness & Authentic Respect *(Buying genuine internal absolution from a wronged autonomous agent)*	**Personally Non-Transferable / Sovereignty Conflict** Tier 10 (Absolute • OTL)	**Infinite QC Fails:** Payment can buy a legal release, public pardon, or behavioral compliance, but financially inducing internal forgiveness turns it into a mercenary transaction, falsifying its authenticity.	**QC:** Decomposes target into legal settlement (purchasable) vs. internal moral state (`TERM_OTL_CATEGORY_ERROR`). **1COIN / NCOIN:** `1COIN` settles legal restitution; prior harm remains logged as `NCOIN-R` until genuinely remediated. **Red-Team:** Compensation genuinely softens anger. *Rebuttal:* Restitution is a causal catalyst, not direct purchase of the internal state.
5. Retroactive Causal Erasure of a Completed Event *(Making it true in the base timeline that a past catastrophe never occurred)*	**Causally & Logically Impossible** Tier 9 (Absolute in Linear Time • Conditional in Branching Sim)	**Adv. Civ / Sim Test:** In `ENV-1/2` (linear causality), the past is fixed. In `ENV-3` (nested simulation), an Architect can roll back a saved state, but the rollback event itself remains part of meta-history.	**QC:** In `ENV-2`, returns `TERM_NULL_INCOHERENT` for literal erasure, or decomposes into remediation/concealment. In `ENV-3`, prices state-rollback compute. **1COIN / NCOIN:** State rollback emits massive `NCOIN-E` (entropy/erased timeline displacement). **Red-Team:** Closed timelike curves. *Rebuttal:* Creates a branching timeline rather than erasing the original occurrence.
6. Unconditional Immunity from Entropic/Informational Decay *(A guaranteed immortal state across infinite time immune to all causal contingency)*	**Physically & Epistemically Impossible** Tier 9 (Absolute • ATB)	**No Seller:** No entity possesses authority over all future causal contingencies or cosmic thermodynamics. **Infinite QC:** Can buy redundancy, backups, and security, but probability $P = 1.0$ over $t \to \infty$ cannot be conveyed.	**QC:** Rejects absolute guarantee (`TERM_ATB_NO_SELLER`); offers Dynamic/Relational risk-mitigation stream (Tier 3). **1COIN / NCOIN:** `1COIN` settles finite insurance/compute tranches; `0 NCOIN`. **Red-Team:** Post-scarcity outside linear time. *Rebuttal:* Even extra-temporal systems cannot sell logical immunity against their own termination by a higher ontological layer.

Case & Rank (Strongest = 1)	Barrier Classification & Tier	Six-Test Diagnostic (Seller, Ownership, Infinite QC, Voluntary, Adv. Civ, Sim)	Trinity Behavior (QC / 1COIN / NCOIN) & Self-Red-Team Attack
7. Holistic Ownership of a Natural Cosmic Body or Biosphere *(Purchasing a star system or living biosphere as absolute chattel property)*	**Conceptually Non-Ownable / No Legitimate Seller** Tier 8 (Hard Case 1 • Conditional vs. Absolute)	**No Seller Test:** Who holds original title to a naturally formed star? A civilization can sell *recognized jurisdiction*, *orbital slots*, or *extraction rights*, but not metaphysical authorship.	**QC:** Evaluates replacement/resource value $V(T)$, but flags `TERM_ATB_NO_SELLER` for holistic title; decomposes into Tier 3 stewardship/extraction rights. **1COIN / NCOIN:** `1COIN` settles jurisdictional treaty; `NCOIN-E/R` tracks biosphere depletion. **Red-Team:** A Kardashev-III empire claims sovereignty by force. *Rebuttal:* Force establishes de facto control and legal exclusion, not ontological ownership.
8. Pre-Committed Future Scientific Discovery *(Buying the verified truth of an unsolved theorem or physical law before discovery)*	**Epistemically Impossible** Tier 8 (Hard Case 2 • Epistemic Boundary)	**No Seller / No Subject:** Prior to discovery, nobody holds the verified truth to sell, and the outcome (true vs. false) cannot be pre-specified by contract without falsifying objective inquiry.	**QC:** Cannot buy a predetermined truth-value (`TERM_OTL_CATEGORY_ERROR`); resolves instead to R&D compute/talent commitment (Tier 3/4). **1COIN / NCOIN:** `1COIN` settles research allocation. **Red-Team:** An Oracle AI computes it instantly upon payment. *Rebuttal:* That is purchasing high-speed compute service (Tier 1/3), not purchasing truth independent of inquiry.
9. Exclusive Ownership of a Shared Cultural Language or Mathematical Notation *(Acquiring absolute property rights to remove a living language from human/AI minds)*	**Ontologically Non-Transferable & Sovereignty Conflict** Tier 7/8 (Hard Case 3 • Distributed Commons)	**No Single Seller:** A living symbolic commons is co-constituted across millions of autonomous minds. Even if a state sells legal copyright, internal cognitive possession cannot be transferred without neural coercion.	**QC:** Under `AUTH-1` , fails seller/consent test (`TERM_ATB_NO_SELLER`). Under `AUTH-3` (Sovereign), could price licensing rights, but cognitive erasure violates personhood boundary. **1COIN / NCOIN:** Coercive suppression generates severe `NCOIN-C` (cultural/epistemic harm). **Red-Team:** Corporate IP buyouts. *Rebuttal:* IP law restricts commercial reproduction, not internal cognitive thought.

Case & Rank (Strongest = 1)	Barrier Classification & Tier	Six-Test Diagnostic (Seller, Ownership, Infinite QC, Voluntary, Adv. Civ, Sim)	Trinity Behavior (QC / 1COIN / NCOIN) & Self-Red-Team Attack
10. Recursive Acquisition of the QC Valuation Oracle Itself *(Using 1 QC to purchase absolute control over the mechanism that defines V(T))*	**Logically Self-Referential / Systemic Paradox** Tier 9/10 (Hard Case 4 • Recursive Boundary)	**Infinite Currency / Paradox Test:** If $QC(Oracle) = V(Oracle)$, and the buyer gains the power to redefine $V(T) = o$ retroactively, the transaction invalidates the very valuation rule that authorized its own settlement.	**QC:** Triggers Privileged-Object Hierarchy Rule; returns `TERM_REJECTED_PRIVILEGED_ROOT` (a specialized QRND state). **1COIN / NCOIN:** `0` / `0` (or `NCOIN-L` governance violation flag if attempted maliciously). **Red-Team:** What if the Architect uses QC to upgrade the Oracle? *Rebuttal:* Funding an upgrade is a Tier 3 R&D service allocation, whereas buying the root authority via its own token is a circular exploit.

C.1 Second-Order Synthesis: Where Does Currency Stop Working as a Concept?

Across ChatGPT's, Grok's, and Gemini's independent boundary passes, a unified theoretical law emerges: **Currency is fundamentally a relational operator that mediates the transfer of alienable rights over controllable states of affairs between distinct agents.** Therefore, currency stops working as a concept at the exact point where **alienability** or **referential coherence** collapses:

1. **When the target is the precondition of the transaction itself** (the substrate of reality, formal logic, or the root valuation protocol).
2. **When the target is constitutively bound to first-person subjectivity or autonomous agency** (consciousness, personhood, authentic love, moral forgiveness), such that alienating the target via payment destroys the very property the buyer sought to acquire.
3. **When no entity in the universe possesses legitimate standing to convey title** (cosmic bodies, laws of physics, completed history, objective truth).

By enforcing the **Absolute Transaction Boundary (ATB)** and the **Quantum Resolution Null Domain (QRND)** inside the Laboratory Charter, Quantum Credits retains its extraordinary speculative power—evaluating non-market, classified, simulated, and century-scale targets—without collapsing into conceptual incoherence.
