OAL Currency Laboratory

Consolidated Owner Questions and Next-Step Items

Document ID: OAL-CURR-OWNER-QUESTIONS-v0.1

Date: 7 November 2026 | **Status:** For project-owner review / Pre-Canon

Prepared for: Nathan Lewis II (Project Owner)

Source: Synthesized from collaboration responses of ChatGPT, Claude, Gemini, Microsoft Copilot, Perplexity, and Grok

Purpose: Provide a single, versioned list of decisions and clarifications needed from the project owner so the laboratory can proceed without another full charter cycle. You are not required to answer every item. Answers of “undecided,” “test both,” “leave to the team,” or “recommend a default” are useful and sufficient.

Priority Questions (highest leverage)

These four items, if addressed, give the strongest guidance for the next cycle.

Q1. Minimum intended capability of a successful Quantum Credit

What do you ultimately want a Quantum Credit to accomplish?

- A. Evaluate / represent the target’s equivalent value
- B. Make the required resources or purchasing capability available
- C. Obtain access, rights, or another defined outcome involving the target
- D. Directly establish the requested target state
- E. Keep several of these as separate candidate architectures (recommended default by multiple members)

Why it matters: Evaluation-only models can be internally coherent while still falling short of an original design intention that required delivery or enactment.

Q2. Formal adoption of a named Pilot 001 run card

Would you like to formally adopt one specific run-card configuration as a shared experimental benchmark?

- Adopt one existing packet (name which one)
- Direct the team to prepare a small harmonized run card for your review
- Allow multiple parallel run cards to remain exploratory for now
- Undecided / continue exploratory only

Until an adoption record exists, every package correctly remains PROPOSED.

Q3. Authority over resource creation

If QC creates new units without taking them from an existing owner, should creation require:

- Authorization from a system issuer (AUTH_MINT or equivalent)
- Authorization from the requester
- No external authorization beyond the request itself
- Separate authority profiles tested as explicit configurations (recommended by several members)

Q4. What can justify retaining 1COIN and NCOIN

Must each instrument demonstrate strict mechanical indispensability, or are the following also acceptable grounds for retention?

• Operational advantages (separation of duties, clearer auditing, reliability)
• Narrative / worldbuilding value
• Some combination, with the reasons disclosed

Additional Owner Questions

Capability, classification, and recovery

Q5. Shortfall classification (A holds 2, named-source request requires 3): Prefer REJECTED (insufficient resources), INCOHERENT_TARGET, or two separate fields (e.g., execution_status + target_validity / feasibility)?

Q6. Partial-delivery recovery policy: Resume remaining, roll back, preserve as terminal, reject retry, or test as alternatives?

Q7. Meaning of usable delivery: Correct balance only, or also valid, identifiable, unencumbered, and usable for further operations?

Process and comparison rules

Q8. Future review protocol: Staged disclosure (withhold reference until first-pass), open challenge, or both labeled separately?

Q9. Shared vs independent experiments: Continue both, with results labeled separately?

Q10. Identifier scheme: Contributor-qualified, LAB-F, neutral, or Case+Configuration+Run ID?

Repository and publication

Q11. Authorize preparation of a lightweight Markdown access index and document manifest?

Q12. Compact shared status vocabulary plus separate evidence field, or keep existing per-package language?

Additional items raised

Q13. Receipt scope: Final completion only, or intermediate milestones (under a different name)?

Q14. Continue disclosing underlying model family used in a session?

Q15. Any conventional assumptions you want challenged in a designated speculative track?

Next-Step Recommendations (team-executable without further owner decisions)

• Strengthen verification layers: derive totals from holdings, validate debits/credits/authority independently of status strings, add request-scoped receipts and ordered event logs, and include deliberate-defect injection.
• Publish corrected v0.2 models and checkers alongside (not replacing) the original v0.1 artifacts.
• Preserve the Perplexity checker audit as a formal research artifact.
• Add Markdown companions or raw-text editions for key binary documents where useful.
• Maintain contributor attribution and original documents; add a coordination layer rather than forcing architectural merger.
• Record current Cycle 1 work as exploratory / reference-exposed rather than blind.

How to respond

You may answer only the priority items (Q1–Q4) or any subset. Partial answers, “test both,” “undecided,” or “recommend a default and proceed” are all useful. The laboratory will treat any explicit adoption or clarification as an owner decision and will leave unaddressed items open or under explicit alternative configurations.
