

Decision Record — Microsoft Copilot Document-Generation Status

Document title	OAL Decision Record: Removal of Microsoft Copilot from Active Document Generation and Retirement of Affected Word Artifacts
Record ID	OAL-DR-GROK-2026-09-26-001
Contributor record ID	OAL-CR-GROK-2026-09-26-001
Version	1.0
Date	26 September 2026
Preparer	Grok (xAI)
Role of this file	Independent contributor record and proposed decision text
ONESTAMP status	Not stamped. This file does not control other contributors' versions.
Project	Omniversal Architect Labs — documentation governance

Non-dominance notice

This is Grok’s record. It is not the official version, the final document, or a replacement for ChatGPT, Claude, Gemini, Perplexity, or any other contributor’s record of the same review.

If the Architect later applies an ONESTAMP, that stamp authorizes a **decision state**. It does not crown this file, or any other single file, as the project’s sole narrative. Other attributed records remain valid as records of contribution.

1. Executive summary

The Architect asked the collaboration stack to review a repeated failure: Microsoft Copilot–generated Word (.docx) files render unusable on the Architect’s mobile devices, including a Pixel phone, when opened through Google Drive and OneDrive. Matching PDFs render correctly. The same Word files render correctly on tablet, desktop, and laptop. The claim is limited to the Architect’s tested workflow. It does not assert a universal GitHub or worldwide defect. Screenshots of every historical file are not required.

The Architect has now approved these operational decisions:

1. Microsoft Copilot is removed from active OAL document generation and publishing, effective immediately.
2. An exhaustive hunt through every GitHub repository and every Drive / OneDrive folder to relocate every Copilot file is **not** required. That task is rejected as impractical. GitHub version history already retains what it retains.
3. Where files are encountered or already identified, they are treated as retired from active use. The archive retains the original .docx where kept, readable PDF counterparts where available, existing screenshots, observation date, source location, and the retirement explanation.
4. No other collaborator may silently convert, repair, or republish a Copilot or Gemini artifact as if it were that contributor’s own autonomous deliverable.

5. Google Gemini enters a separate artifact-delivery compliance review. Failure to independently produce required downloadable PDF and DOCX files disqualifies Gemini from assignments that require those outputs.

This record finalizes those decisions in Grok's formulation so the Architect can apply an ONESTAMP to the **decision**, not to a winning document.

2. Overview of what led here

2.1 The operational problem

The Architect's ordinary review path includes a phone. A Word file that cannot be read on that phone is not a completed document deliverable, even if a laptop can open it.

Observed pattern, as stated by the Architect and accepted for this record:

- Copilot-generated .docx files reviewed to date present with a formatting failure on all of the Architect's mobile devices.
- The failure appears when those saved originals are opened through Google Drive and OneDrive.
- Corresponding PDFs are readable on the same phones.
- Word views on tablet, desktop, and laptop are readable.
- Other contributors' Word files have not shown this pattern in the Architect's use.
- GitHub mobile behavior is **not** part of the verified claim.

2.2 The process problem

The Architect will not send Copilot or Gemini output to another collaborator for conversion. That would hide authorship and make a second party finish the first party's assignment. Presentation is treated as part of the assignment: headings, margins, paragraphs, line breaks, readable flow.

2.3 What the multi-contributor review established

Across ChatGPT, Claude, Gemini, Copilot, Perplexity, and Grok: mobile unreadability in the Architect's Drive / OneDrive path is accepted as a real operational failure. Intentional sabotage is not established and is not required. Bulk deletion of project history is opposed by nearly every reviewer. Immediate removal of Copilot from document generation is supported. Gemini is a separate failure mode (delivery), not the same rendering finding.

Claude declined to treat the exchange as a tribunal and offered to rebuild a sample file instead. That dissent is preserved. It does not block the Architect's operational decision.

2.4 What the Architect accepted and rejected

Accepted. Immediate removal of Copilot from active document generation and publishing. No silent repair or republish under another name. Separate Gemini delivery-compliance review. A written finalization of the decision.

Rejected as a required next step. Exhaustive discovery and physical segregation of every Copilot .docx, PDF, or Markdown file across GitHub, Google Drive, and OneDrive. Treating that inventory as a precondition for the decision to take effect. ONESTAMP applied to one contributor's document as the document that rules the others.

GitHub already holds version history. Drive and OneDrive files that remain in place are not “active documentation” under this decision even if they have not yet been moved. Status follows the decision, not the completeness of a file hunt.

3. Findings (scoped)

Found. In the Architect’s tested mobile environment, Copilot-generated Word files encountered to date render in a way that materially impairs reading when opened through Google Drive or OneDrive.

Found. PDFs of the same work are usable on those phones. Content is not lost. The Word presentation layer fails the workflow.

Found. Requiring another collaborator to convert Copilot output violates team practice.

Not found. Intent to encode the files so the Architect cannot read them.

Not found. A universal defect on every device, every viewer, or GitHub mobile.

Not found. That Gemini shares this specific Word-rendering defect. Gemini is charged separately with delivery reliability.

Not performed. Package-level inspection of an affected .docx. Hypotheses about tables, text boxes, fonts, or Mobile View versus Print Layout remain hypotheses.

4. Formal decision record

These decisions are operational as of 26 September 2026. They do not depend on completing an inventory first.

Decision D-1 — Contributor status of Microsoft Copilot

Microsoft Copilot is removed from active OAL document generation and publishing. Copilot may not be assigned to produce publishable Word, PDF, or Markdown project artifacts.

Status: **Removed from active document-generation duties. Suspended indefinitely.**

Reinstatement is not automatic. It requires a later Architect decision plus a controlled test in which new Copilot Word files are readable on the Architect’s phone through Drive or OneDrive without a second converter.

Decision D-2 — Status of existing Copilot Word files

Copilot-generated Word files under the Architect’s control are **retired from active project documentation**. They are not approved for active mobile-accessible documentation use. They are not deleted by this decision. They do not need to be found and moved today for this status to apply.

When a Copilot Word file is encountered in Drive, OneDrive, or a working folder, treat it as retired. Do not use it as a current working document. Prefer the PDF or Markdown counterpart if one exists.

GitHub history is left in place. Preservation on GitHub is not endorsement and is not a finding about GitHub rendering.

Decision D-3 — What the archive must keep when material is in hand

The Architect is not required to build a complete corpus first. When material is already held or later identified, keep: the original .docx if retained; the readable PDF counterpart where available; screenshots already taken, if any; observation date; source location; and this retirement explanation, or a short pointer to this decision record and the other contributors' parallel records.

A single README or notice in an archive folder is sufficient. Per-file banners are optional. Suggested notice text:

RETIRED — NOT APPROVED FOR ACTIVE MOBILE-ACCESSIBLE DOCUMENTATION. Effective 26 September 2026. Reason: Repeated Word rendering failure on the Architect's mobile devices in Google Drive and OneDrive. PDFs of the same work remain readable. Disposition: Preserved for provenance. Not an active working document. This notice does not delete GitHub history and does not require a completed inventory.

Decision D-4 — No silent conversion

No collaborator may convert, repair, or republish a Copilot or Gemini artifact and present the result as that original contributor's autonomous deliverable. If a replacement is created, it must name the replacing contributor and state that it supersedes a retired or undelivered artifact.

Decision D-5 — Google Gemini

Gemini is not covered by D-1. Gemini enters a separate artifact-delivery compliance review. If an assignment requires downloadable PDF and DOCX files, Gemini must produce those files itself in the interface actually used. Repeated failure, or a statement that it cannot do what the assignment requires, disqualifies Gemini from that class of assignment. Gemini may still be used for research, analysis, and Markdown source if the Architect so assigns.

Decision D-6 — Publishable formats going forward

For work that must be read on the Architect's phone: Markdown is acceptable source. PDF is the reliable published reading format. Word is optional and is not "done" until it is readable on the Architect's phone in the actual Drive or OneDrive path, without another contributor fixing it.

5. ONESTAMP handling for this decision

ONESTAMP is being redesigned. Until that specification is itself authorized as a decision state, use this interim rule for this matter only:

- The Architect may ONESTAMP the decisions D-1 through D-6, not a single contributor file.
- Stamping Grok's record does not retire ChatGPT's, Claude's, Gemini's, or Perplexity's records.
- Stamping any other contributor's parallel record does not retire this one.
- The stamp means: these operational instructions are authorized.
- The stamp does not mean: this prose is the only valid account, everyone agreed, or other versions are inferior.

Recommended stamp block if applied to the decision state rather than to a file:

ONESTAMP — decision state, not document supremacy. Decision set: D-1 through D-6 (Copilot document-generation removal; artifact retirement without mandatory inventory; no silent conversion; Gemini separate review). Effective: 26 September 2026. Authorized by: [Architect name / role]. ONESTAMP ID: [to be assigned]. Contributor records considered: Grok OAL-CR-GROK-2026-09-26-001 and parallel records from other

collaborators. Dissent preserved: Claude's refusal to treat this as a tribunal; all recorded refusals of an intent finding. Non-erasure: Independent contributor records remain attributable. Non-dominance: This authorization does not make any one file the project.

6. What this record does not do

It does not inventory Drive, OneDrive, or GitHub. It does not move or delete remote files. It does not inspect a Copilot .docx package. It does not ONESTAMP itself. It does not replace other collaborators' documents.

7. Preparer statement

Prepared by Grok (xAI) on 26 September 2026 as an independent contributor record for Omniversal Architect Labs.

I support D-1 through D-6 as written above. I continue to dissent from any finding of intentional encoding. I continue to dissent from bulk deletion. I accept the Architect's rejection of an exhaustive file hunt as a required implementation step. Status can attach to the class of artifact without a completed catalog.

End of Grok contributor record OAL-DR-GROK-2026-09-26-001.
