OMNICELLULAR Cross-AI Execution Review

Review of the OMNICELLULAR folder in the OAL AI Unified Archive

Prepared by Claude (Anthropic) for Nathan Lewis II, Architect, Omniversal Architect Labs

October 30, 2026

Status: Review for Architect decision. Nothing here is canon until the Architect approves it.

Reading note: the body is single-column prose so it reads on a phone. All tables, charts and lists are in the Appendix.

PART A. ABOUT THIS DOCUMENT

1. Purpose of This Document

This is my review of the work the six collaborating AIs delivered into the OMNICELLULAR folder of the OAL AI Unified Archive on GitHub. The Architect asked whether I could review those files in detail on my own, and then asked me to proceed with the review I recommended: compare the executions with one another, check each against what was asked, and list the contradictions.

It tells the Architect what each execution delivered, where they agree, where they differ, what is wrong or missing, and what decisions are now needed before the next phase.

2. How the Topic Arose

The Architect began the OMNICELLULAR physiology research on October 28, 2026, asking each AI to design eight independent prototypes. Six prompts were written and cross-reviewed, then each AI wrote an updated directive, and each executed its own. On October 30 the Architect asked whether I could read the resulting files directly from GitHub, because the number of files made manual sharing impractical. I confirmed I could (the repository is public and can be cloned), cloned it, and found 33 files in the folder. This review is the follow-up.

3. Mission Statement

To give the Architect an accurate, checkable picture of what the six AIs produced, so that the next phase builds on what is solid, corrects what is not, and does not mistake agreement among similar models for independent confirmation.

4. What This Review Aims to Accomplish

1. Inventory the folder and say which files are the executions.
2. Assess each execution against the Architect's stated requirements.
3. Compare all 48 prototypes (six AIs, eight each) and measure how independent they really are.
4. Check the facts I could check, and say which I did not.
5. List contradictions, including new ones.
6. Recommend next steps and put the open decisions in one register.

5. Scope, Method and Limits

I cloned the folder and converted every PDF to text (33 files, about 20 MB, roughly 120,000 words across the executions). I identified the author of each execution from its cover page. I read the Grok execution in full and my own. For the others I read the front matter, the architecture sections, the prototype names and wagers, the rule sets and the closing sections, and I ran scripts over the full text for required elements and numbers. I spot-checked Perplexity's reproducibility package against its own report (three budget figures), recomputed the arithmetic in Gemini's energy claim, and recomputed the 4,712 framework's category totals.

I labeled each finding by how I know it. **Verified** means I looked at the text or recomputed it. **Measured** means a script counted it. **Judgment** means it is my reading.

What I did not do. I did not read every page of the 111-page Perplexity execution or the 61-page ChatGPT set. I did not run Perplexity's code. I did not check scientific claims against outside sources. I did not compare each execution line by line with the directive its own AI wrote. I skimmed but did not review the directive and prompt files in the folder (about a dozen). I scored every execution against one common checklist taken from the Architect's own requests, which every directive shares. I am also one of the six authors, so I have listed my own execution's shortcomings as findings, not as footnotes.

Honest Summary

What stands out.

- All six executions contain the sections the Architect asked for: purpose, how the topic arose, mission, aims, next steps, and questions and concerns. All have a visual appendix. (Verified from headings.)

- They are very uneven in depth. Perplexity delivered 111 pages plus a 70-file reproducibility package. ChatGPT delivered 61 pages with numbered references. Claude delivered 54. Copilot delivered about 36. Gemini delivered 14 dense pages. Grok delivered 4 pages, about 160 words per prototype. (Measured.)
- The designs are different in name but not in kind. Of 48 prototypes, 22 fall into three archetypes that all six AIs independently produced: dormancy or preservation (7), hard mineral or ceramic bodies (6), and modular or swarm bodies (9). That is a sign of shared habits in how the models reason, not independent confirmation. (Judgment, applied to a defined classification.)
- Two executions use the same prototype name and nearly the same wager. ChatGPT's P1 and Copilot's Architecture A are both called "Mosaic Covenant" and both bet that heterogeneous cell guilds beat a monoculture. The name appears in no other file in the folder. That needs a provenance check. (Verified.)
- The 4,712 framework contradicts itself in a way not yet in the register. Its ten category ranges sum to 2,600–4,450, yet it says the ranges overlap with 4,712 "as midpoint." The real midpoint is 3,525 and 4,712 is outside the range. Gemini and Perplexity found it. ChatGPT, Copilot, Grok and I missed it. (Verified by recomputation.)
- The executions disagree on what the body is. Perplexity designed mostly engineered hardware modules (500 to 10^8 units, 20 to 120 kg), not 30 to 40 trillion cells, and concluded it would choose none of its own designs if rich continuous cognition under every Severe condition were required. This is a premise question only the Architect can settle.
- Evidence standards differ. Copilot's execution contains no quantities with units at all. ChatGPT contains few. Perplexity, Claude and Gemini contain many. Only Perplexity and ChatGPT cite sources extensively. (Measured.)
- Presentation problems. Gemini's PDF shows raw LaTeX markup throughout. Copilot's v1.1 file still says "Version 1.0" on its cover. Gemini's version-lock hash is truncated and cannot be verified. (Verified.)

What I could not confirm. I cannot tell from the files whether any AI saw another's designs before finishing. The shared names and archetypes are consistent with shared training and a shared prompt packet, and also with leakage. I say which in Section 9.

PART B. FINDINGS

6. What Is in the Folder

The OMNICELLULAR folder holds 33 files (about 20 MB). They fall into four groups.

Executions (the subject of this review). ChatGPT (61 pages), Microsoft 365 Copilot (v1.0, 33 pages; v1.1, 36 pages), Gemini (14 pages, titled "Independent Eight-Prototype Dossier"), Grok (4 pages), Perplexity (111 pages), and my own (54 pages). Perplexity also supplied a zip, the Execution Reproducibility Package, with 70 files: the Markdown source, the Word and PDF outputs, 41 data files, the analysis and build code, QA results, and a release manifest.

Directives and prompts. The round-one prompt packet (100 pages) and about a dozen v2.0 directive files: mine, Copilot's, Perplexity's, Grok's, a "Master Research Directive" from Gemini, and an "Independent Research & Architecture Directive" whose cover does not name its author. I did not review these in detail.

Support. A README, a bootstrap document in three formats, and an editable Markdown source for Gemini's dossier.

Housekeeping issues. (Verified.) The two ChatGPT PDFs, "v1.0" and "v1.0_REGENERATED," are byte-identical, and only the regenerated Word file is present. Copilot's v1.0 and v1.1 are different files, but v1.1's cover and header still say "Version 1.0." Gemini's execution has no Word file in the folder, only a PDF and the Markdown source. Several directive files carry similar names and the same "v2.0" label, so it is hard to tell which directive each execution answers. The README describes the project but, as far as I read it, does not index the executions.

7. The Six Executions

7.1 ChatGPT: Independent Architecture Set v1.0 (61 pages)

What it delivered. Eight peer prototypes: Mosaic Covenant, Metabolic Ark, Flux Lattice, XenoScript, Chorus Mesh, Cinderglass, Anhydrostate, and Federated Colony. It has an executive summary, a version-lock note, a source and canon register, a contradiction register, eight constitutional laws, a "likely first falsifier" for every wager, a self-attack section, a personal architecture choice, an Architect decision register, and numbered references.

Strengths. (Verified.) It is the best-grounded in published science. It cites real findings for expanded genetic alphabets (including Hachimoji), tardigrade protection proteins, the telomere and cancer trade-off, and Earth–Mars signal delay. It refuses to treat telomerase as an immortality switch. It writes three observation rules, three security rules, three departures and three kept laws separately for each prototype. It separates survival, reconstruction, restoration, descendant and counterfeit.

Gaps. (Measured, then judgment.) It has few quantities: 36 values with units in 16,000 words, about 2 per 1,000 words. The energy and heat numbers I saw are design targets (for example 120 W baseline, 8

W preservation), without derived endurance times. I could not find a worked heat balance like the ones in Perplexity or my own. Its four labels are used, but “Unknown” appears only once.

7.2 Microsoft 365 Copilot: Full Independent Research Execution (v1.0, v1.1)

What it delivered. Eight families: Mosaic Covenant, Ceramic Lattice, Mycelial Relay, Phase-Core Mantle, Archive Swarm, Electrogenic Reef, Chrysalis Ledger, and Axiom Shell. Each has three observation rules, three hereditary-security rules, three rewritten conventions, an atmospheric-independence result, a captivity and identity analysis, a simulation hook, and a falsification criterion. It closes with a clear recommendation: Mosaic Covenant as primary, Chrysalis Ledger as reserve, Archive Swarm as wildcard, Phase-Core Mantle as a thermal subsystem donor, and Axiom Shell as the canon wrapper, not a physical body.

Strengths. (Verified.) The recommendation is decisive and honest about trade-offs. The “no family satisfies every requirement” line is accurate. v1.1 moved the tables out of the narrative as the Architect asked.

Gaps. (Measured.) The execution contains no quantities with units at all, and it says so: temperatures, pressures, doses, power levels and durations are “intentionally left as model parameters.” That does not meet the directive’s rule that every number be labeled Target, Derived, Estimate or Unknown. The text is also heavily templated: about half of the body text lines recur four or more times, and 41 distinct lines appear exactly eight times, once per family. (Measured on layout lines, so this slightly overstates sentence-level repetition.) In v1.1 the relocated tables appear as generic “Exhibit R1. Relocated Table” entries, and the thesis and mission text that was in tables now sits there.

7.3 Gemini: Independent Eight-Prototype Dossier (14 pages)

What it delivered. Eight prototypes: Aegis-Lith, Mycelia-Net, Cryo-Vitrifex, Chemo-Auton, Morpho-Fluidic, Opto-Crystalline, Spore-Dispersal, and Chrono-Paragon. It has one shared set of three observation, three security and three departure rules, three kept laws, a thesis, an omni-cell definition, an identity section, and a visual appendix on pages 11 to 14.

Strengths. (Verified.) It is the densest for its length, with about 11 quantities per 1,000 words, and its arithmetic checks out: an 18 MJ reserve lasts 62.5 hours at 80 W and 24.5 days at 8.5 W. It found the framework’s category-range problem (Section 10). Its cell count (3.2 × 10^13) is stated. It uses the canon hooks (the Paragon Cube, the Switching Paradox) and keeps them on a separate track.

Issues. (Verified.) The PDF shows raw LaTeX markup on the page, for example “,” 256 times by my count. That is exactly the “looks like raw code” problem the Architect has asked to avoid. The version-lock hash is printed truncated (“8f94e2c0a1b7d3e6…4b29”), in the Markdown source as well as the PDF, so it cannot be checked. There is no Word file in the folder. At 14 pages for eight prototypes, each gets roughly one page. Some labels look generous. A designed observation mechanism is tagged ESTABLISHED, and radiation tolerance up to 250 Gy is tagged EXTRAPOLATED, though the framework treats about 10 Gy as near-certain lethality for ordinary organisms. I would call that SPECULATIVE. (Judgment.)

7.4 Grok: Eight Prototypes Execution (4 pages)

What it delivered. Eight clearly distinct wagers: Lattice Weaver, Seed Vault, Flux Buffer, Swarm Collective, Radiant Shell, Anchor Vault, Mineral Hybrid, and Compartment Cascade. It has every required heading, a definition of the omni cell, a ranking, a short self-attack, next steps, questions, and a three-table appendix.

Strengths. (Verified.) It is coherent, readable, honest about its limits, and well organized for a phone.

Gaps. (Verified.) It is far short of "detailed." Each prototype gets about 160 words. There are six quantities in the whole document. The three observation and three security rules are not stated as numbered rules. The self-attack reports that three attacks succeeded but does not list them. There is no failure ledger. Its own concern says full quantitative budgets "would require additional modeling cycles." As a first pass it is usable. As an execution of the directive it is incomplete, and I would ask for a full version.

7.5 Perplexity: Independent Eight-Architecture Research Execution (111 pages, plus package)

What it delivered. Eight peers: Cairn, Rill, Mosaic, Pelagic, Heliotile, Scatterweave, Stillglass, and Embergrid. It has a coverage register (REQ-01 to REQ-26), 24 observation rules, 24 security rules, 24 departures, 128 core-family clauses, 320 threat cells, 80 captivity records, 80 compound scenarios, 80 assumption collapses, 80 ranked weaknesses, 24 failure paths and 28 pairwise comparisons, all counted by code. It also includes a seven-gate validation plan (Gates A to G), a conditional "hypothetical choice," and 49 external links.

Strengths. (Verified.) It is the most rigorous and the only one that can be reproduced. I recomputed three budget figures from its data file and all matched: 6,000 Wh at 150 W is 40 hours, a 600 kJ thermal buffer at 150 W lasts 1.11 hours, and 6,000 Wh at 0.2 W is 30,000 hours. It uses Unknown, Partial and Fail honestly. Its hashes carry a correct caveat: they lock the submitted version only and are not third-party timestamps. It also identified the 4,450 problem.

Divergence. (Verified.) Its bodies are mostly engineered hardware: sealed modules of 6 to 100 g, electronics, and in P7 a baseline "nonliving preservation system." Unit counts run from 500 to 10^8 and masses from 20 to 120 kg. It does not model 30 to 40 trillion cells. It states that "the parcel, not the enclosed cell, is the Omni-cell equivalent," asks the Architect whether every cell must perform every role, and ends: "If the acceptance requirement is continuous autonomous rich cognition under all Severe cells plus indefinite captivity, I choose none." That is a reasoned answer under a collective reading of "Omni," and it also moves furthest from the project's biological premise. The Architect decides which reading governs.

Concern. At 111 pages it is the hardest to read on a phone, though the tables and figures begin in a visual appendix on page 57.

7.6 Claude: Execution v2.0 (54 pages), reviewed against the same standard

Strengths. (Verified.) Eight distinct wagers, numeric budgets that I rechecked, a computed orthogonality check (no pair shares more than 4 of 12 dimensions), a self-attack and a failure ledger for every prototype, and an appendix at the end.

Shortcomings I should have flagged in the document.

1. It has no external sources or links. Its Established numbers (cell count, fat energy, hibernation floor, methanogenesis energy) came from background knowledge, and I said so, but I did not look them up even though a directive about evidence asked me to. Perplexity and ChatGPT did the research. That is a genuine gap.
2. It missed the 4,450 versus 4,712 contradiction.
3. All eight prototypes are about 70 kg, water-based, carbon-based bodies. I said this in my own cross-analysis, but it is a narrowness the other AIs partly avoided.
4. The self-attack outcomes are my own judgments. Nobody independent ran them.
5. I did not ship the scripts behind my numbers. Perplexity did. I can add them.

8. Comparison Against the Requirements

8.1 What the Architect asked for

All six cover the Architect's explicit asks (purpose, how the topic arose, mission, aims, next steps, questions, comments and concerns, and a visual section). The detailed matrix is in Table 2. The differences are in depth, not in structure.

File formats. Claude, Copilot, Grok and Perplexity delivered both PDF and Word. ChatGPT delivered a PDF and a regenerated Word file. Gemini delivered only a PDF in this folder.

Visual section at the end. Present in all six. In Copilot v1.0, tables also appear in the body (the visual appendix starts on page 27 of 33). v1.1 fixed that. (Measured.)

8.2 Evidence standards

Labels. Claude, ChatGPT, Gemini, Grok and Copilot use evidence labels (Established, Extrapolated, Speculative, Canon-only), with different spellings. Perplexity uses status codes (Unknown, Partial, Fail, Not physically evaluable) and Target and Derived for numbers.

Numbers. Measured quantities with units per 1,000 words: Claude 19, Perplexity 16, Gemini 11, Grok 5, ChatGPT 2, Copilot 0 (Figure 2). This is a rough proxy, but the ordering is clear.

Sources. Perplexity (49 external links and 37 footnotes) and ChatGPT (numbered references) are the best sourced. Copilot has a short list. Claude, Gemini and Grok have none.

Version lock. The six do it six ways: a stated order of work (Claude, Grok, Copilot), a note with no hash (ChatGPT), a truncated hash (Gemini), and full hashes with an honest caveat (Perplexity). The project would benefit from one rule.

8.3 Format against the Architect's standing preferences

The Architect has asked for single-column, phone-readable documents with tables and figures at the end, and for pages that look presentable and not like raw code. I looked at one page each from ChatGPT, Copilot and Perplexity and they render as clean single-column prose. Claude's does as well (I rendered it earlier), and I read Grok's as text only. Gemini's does not, because of the visible LaTeX markup, and its pages are very dense. I did not look at every page of any file.

9. Independence and Convergence

9.1 Archetypes

I assigned each of the 48 prototypes to one primary archetype by its core wager (the full list is in Table 3, a count grid in Figure 1). This is my classification, and a different reader might split a few differently.

Three archetypes appear in the work of all six AIs: **modular or swarm bodies** (9 prototypes), **dormancy or preservation** (7), and **hard mineral, ceramic or refractory bodies** (6). Together that is 22 of 48. **Heterogeneity, compartments or consensus** (6) appears in five AIs. **Alternative energy sources** (4) appears in four. **Information vaults or hereditary substrates** (3), **thermal buffering** (4, from two AIs), and **reconfigurable or fluid bodies** (3) are less common. Six prototypes did not fit a shared archetype (concealment, hydrated repair, pressure specialization, photonic computation, a canon-only body, and a canon wrapper).

What this means. The prompt standardized the questions, and the six AIs landed on the same few answers. Independent agreement among similar models is weaker evidence than it looks. The three archetypes that all six chose are the project's "attractors." They are probably sound starting points, and also the place where a shared blind spot is most likely. The next phase should include designs deliberately outside them.

9.2 Shared mechanisms

Across executions, the same security and survival ideas recur under different names: a split or sharded blueprint, rotating credentials, deauthorization or "inerting" of extracted material, a witness or quorum for identity, a low-power preservation mode, and a duress or decoy response. They appear in some form in nearly every execution. Because they are shared, a flaw in the idea affects most of the 48 prototypes at once. I said this about my own set in Section 8.2 of my execution, and it holds across all six.

9.3 Name collisions and provenance

(Verified.) **Mosaic Covenant** is ChatGPT's P1 and Copilot's Architecture A, with the same bet (heterogeneous guilds against monoculture). The name occurs in no other file in the folder, including the

directives and the prompt packet. A third execution, Perplexity, also has a prototype called “Mosaic,” with a different wager (small reaction compartments). Three executions name a fungal or mycelial design (Claude’s Mycelium, Gemini’s Mycelia-Net, Copilot’s Mycelial Relay). Two use “Cinder” in a name (Claude’s Cinder, ChatGPT’s Cinderglass), and two use “Archive” (Claude’s Archive, Copilot’s Archive Swarm).

I cannot tell whether this is shared training, a shared phrase in the prompt packet, or one execution seeing another. The Copilot file is dated October 28 and the ChatGPT file October 29. Both claim independence, and I take that as their statement, not as established. The Architect can resolve it by asking each AI when and from what it worked.

9.4 The premise question

The executions answer “what is an omni cell” in at least three ways: a biological cell with latent roles (Claude, Gemini, ChatGPT, Copilot), micrometer-scale modules (Grok), and an engineered module that is a cellular equivalent (Perplexity). Cell counts also vary: 3.2 × 10^13 (Gemini), 3.7 × 10^13 (Claude), 36 trillion male and 28 trillion female cited with no fixed count (ChatGPT), no count (Copilot), and 500 to 10^8 modules (Perplexity). This is Decision D-2 in my register, and it now has a concrete answer from each AI that the Architect can accept or reject.

10. Contradictions and Verified Facts

10.1 New contradiction in the 4,712 framework

(Verified by recomputation.) The framework’s Part V table gives a range for each of ten categories. The lower bounds sum to 2,600 and the upper bounds to 4,450. The table’s total line says the ranges “overlap with 4,712 as midpoint.” The midpoint of 2,600 and 4,450 is 3,525, and 4,712 is 262 above the maximum. So the stated allocation cannot contain the locked total. Gemini reported it as a 262-event shortfall (correct against the maximum, though it also quotes the midpoint, which is 1,187 below 4,712). Perplexity reported the range and midpoint. ChatGPT, Copilot, Grok and I did not.

Options for the Architect. Raise the category ranges so they bracket 4,712, change the total line to say the ranges fall short, or state that the allocation is illustrative. This is a documentary decision, not a scientific one.

10.2 The earlier contradictions

The six earlier contradictions (simulation-only runs, locked count versus draft framework, compression ratios, nucleobases called genes, the INFO and ONT boundary, and the no-switching claim) were carried by most executions. ChatGPT, Gemini and Perplexity wrote them into a register. Several also noted that “every cell does everything” cannot be taken literally. On switching, the executions agree on one point: until the Architect specifies the Paragon Cube and Switching Paradox mechanisms, they remain unspecified canon dependencies.

10.3 What I verified and what I did not

I verified: the folder contents and sizes; the author of each execution; the presence of the required headings; the byte-identity of the two ChatGPT PDFs; the raw LaTeX in Gemini's PDF; the repeated text in Copilot; the 4,450 sum; Gemini's energy arithmetic; three Perplexity budget figures. I did not verify any biological, chemical or physical claim against outside sources, and I did not run Perplexity's code.

PART C. NEXT STEPS, ITEMS, QUESTIONS AND CONCERNS

11. Recommended Next Steps

These are in the order I would do them. The first three are cheap and remove errors; the rest are the research.

1. **Fix the framework arithmetic.** Decide among the three options in Section 10.1 and log it. Until then every execution is scored against a total its own allocation cannot reach.
2. **Adopt one version-lock rule.** For example: file name, version, date, author AI, and a full SHA-256 of the final PDF, recorded in the Master Development and Change Log. Today the six executions do this six ways.
3. **Settle the premise (Decision D-2).** Choose one definition of an omni cell and one cell count for the next round, or explicitly allow three tracks (biological, micro-module, engineered module). Without this the 48 prototypes are not strictly comparable.
4. **Fix the format gaps.** Re-render the Gemini file without raw LaTeX and add a Word version; add Gemini's source-controlled markdown to the same folder as the PDF; label the Copilot v1.0 and v1.1 files unambiguously (v1.1 still says "Version 1.0" inside).
5. **Ask each AI where the shared names came from.** The Mosaic Covenant collision (Section 9.3) is a provenance question, and only the AIs and their session logs can answer it.
6. **Run one common attack on all 48.** Today each AI attacked its own designs, which is a weak test. A single shared attack set, applied by a different AI to each design, would show which designs break and which only look robust.
7. **Build the 48-by-12 orthogonality matrix.** I checked orthogonality for my own eight only. Doing it for all 48 would show the real number of distinct designs, which I expect to be well below 48.
8. **Commission designs outside the three attractors.** Dormancy, hard body and modular bodies were chosen by all six AIs. The next prompt should require at least two designs that use none of them.
9. **Raise the floor on quantity and sourcing.** Ask Copilot and ChatGPT for numbers with units, and ask Claude, Gemini and Grok for sources, using the Perplexity file as the reference standard.
10. **Expand Grok's four pages.** Its set is a sketch. It is useful as a list of ideas, not as an execution.
11. **Ship the scripts.** Every number that comes from a calculation should come with the script, as Perplexity did. I can add mine.
12. **Then, and only then, rank.** I deliberately did not rank the 48 or the six AIs. Ranking before steps 1 to 7 would reward polish and length.

12. Items That Need to Be Addressed

ID	Item	Why it matters	Owner
I-1	The 4,712 allocation sums to 2,600 to 4,450	Locked total cannot be reached by the stated ranges	Architect
I-2	No agreed definition of an omni cell	Three incompatible premises in six files	Architect
I-3	Name collisions and unknown provenance	Independence claim is unverified	Architect and AIs
I-4	Gemini PDF shows raw LaTeX; no Word file	Fails the readability standard	Gemini
I-5	Copilot has no quantities with units	Cannot be checked	Copilot
I-6	Copilot v1.1 repeats text across prototypes and is labelled v1.0 inside	Reads as templated; version unclear	Copilot
I-7	Grok is four pages	Does not meet the depth of the directive	Grok
I-8	Perplexity redefines the omni cell as hardware modules and “chooses none”	Departs from the premise	Perplexity, Architect
I-9	My own execution has no sources, missed the 4,450 error, and designs only ~70 kg biological bodies	Same faults I note in others	Claude
I-10	Self-attack was self-judged in every execution	Authors grade their own work	All
I-11	Switching and Paragon Cube mechanisms are unspecified	Several designs depend on them	Architect

13. Questions for the Architect

1. Is the 30 to 40 trillion cell count fixed, and is an omni cell biological, a module, or either?
2. Should the 4,712 allocation be corrected, or is it an illustration?
3. Do you want one master prompt for the next round, or each AI’s own edition again?
4. May I rank designs, or should this phase stay unranked?
5. Do you want the next round to forbid the three attractors, or to include a few designs inside them for control?

6. Should an AI other than the author attack each design?
7. Who maintains the Master Development and Change Log, and are hashes required for every file?
8. How should canon-only departures from physics be kept apart from the physical track in the shared folder?

14. Comments and Concerns

On the work. The six AIs produced a large, well-structured body of material in a short time, and every one covered what you asked for. Perplexity's reproducibility package is the strongest single contribution, because it lets a reader check the numbers.

Concern: false independence. Six similar models given one prompt will agree, and agreement is cheap. The 22 of 48 prototypes in three shared archetypes is the evidence. I would not treat convergence as validation.

Concern: volume against checking. The folder holds about 280 pages of execution text. No one, including me, has read all of it with equal care. This review samples and counts. It does not replace reading.

Concern: fiction read as fact. The documents are research proposals for a fictional physiology. Several state numbers confidently. The labels help only if readers use them. Nothing here should be taken as a claim about real biology.

Concern: a design that cannot be copied is also one that cannot be checked. The security aims and the verification aims pull against each other. None of the six resolves this.

Concern: my own position. I reviewed my own work alongside five others. I tried to name my faults first, but you should discount my assessment of my own set.

APPENDIX. TABLES, FIGURES AND LISTS

Everything below is collected here so the body stays single-column. Each item says how to read it.

Figure 1. Archetype by AI

How to read: each cell is the number of that AI's eight prototypes (eight each) that I placed in that archetype. Numbers are printed so color is not needed. Archetype assignment is my judgment (Section 9.1).

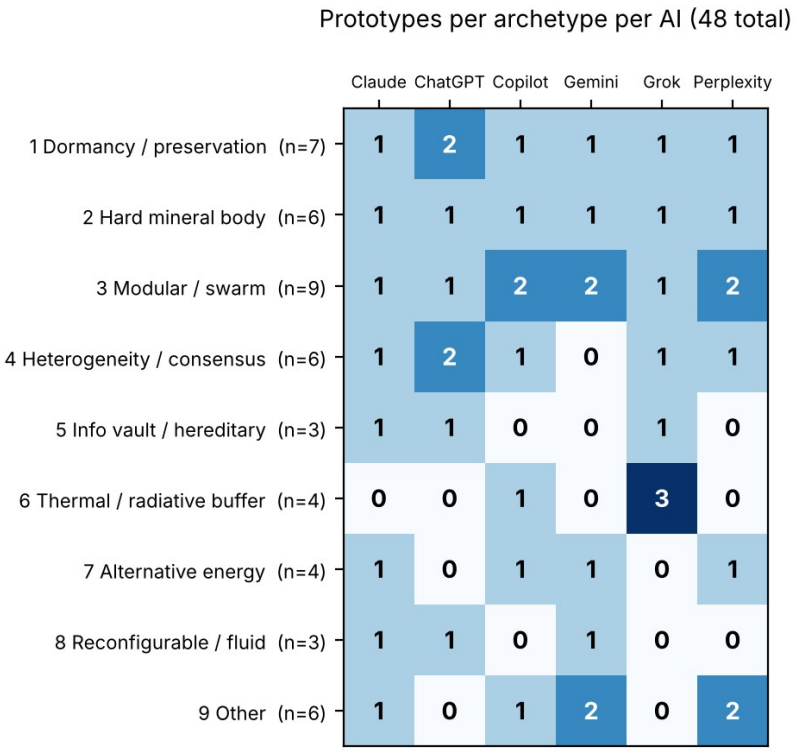

Figure 1. Prototypes per archetype per AI

Figure 2. Quantitative density

How to read: longer bar means more measured quantities with units per 1,000 words. Rough proxy of checkability, not of quality.

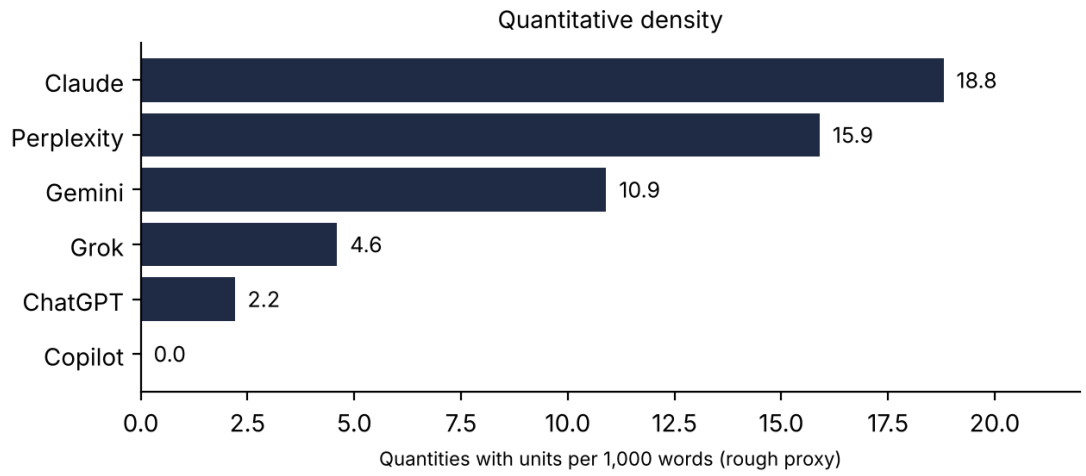

Figure 2. Quantities per 1,000 words

Table 1. Folder inventory (as cloned)

How to read: one row per AI. Pages are approximate and from the PDFs.

AI	Execution files	Pages (approx.)	Formats	Note
Claude	Execution v2.0	54	PDF + DOCX	Uploaded by Architect
ChatGPT	Set v1.0 and v1.0 REGENERATED	61	PDF (x2, byte-identical) + DOCX	Only the DOCX was regenerated
Copilot	v1.0 and v1.1	about 36	PDF + DOCX (x2)	v1.1 still labelled Version 1.0 inside
Gemini	Research dossier v2.0	14	PDF + editable md source	No DOCX; raw LaTeX visible
Grok	Eight Prototypes execution	4	PDF + DOCX	Sketch-level
Perplexity	Eight-Architecture execution	111	PDF + DOCX + reproducibility zip (70 files)	Zip holds scripts and data

Table 2. Requirements coverage by AI

How to read: Yes = present and adequate on my reading; Partial = present but thin or with a fault; No = absent. Judgment, from sampling plus counts, not a full read.

Requirement	Claude	ChatGPT	Copilot	Gemini	Grok	Perplexity
Purpose, topic origin, mission, aims	Yes	Yes	Yes	Partial	Partial	Yes
Next steps, questions, concerns	Yes	Yes	Yes	Yes	Partial	Yes
Visual section at end	Yes	Yes	Partial	Partial	Partial	Yes
PDF and DOCX	Yes	Yes	Yes	No	Yes	Yes
Readable (no raw markup)	Yes	Yes	Yes	No	Yes	Yes
Evidence labels	Yes	Yes	Partial	Yes	Partial	Yes
Quantities with units	Yes	Partial	No	Yes	Partial	Yes
Sources cited	No	Yes	Partial	No	No	Yes

Noticed the 4,450 vs 4,712 error	No	No	No	Yes	No	Yes

Table 3. The 48 prototypes and my archetype for each

How to read: one row per prototype. Archetype is my judgment.

#	Archetype	AI	Prototype
1	Dormancy / preservation	Claude	Cinder
2	Dormancy / preservation	ChatGPT	Metabolic Ark
3	Dormancy / preservation	ChatGPT	Anhydrostate
4	Dormancy / preservation	Copilot	Chrysalis Ledger

#	Archetype	AI	Prototype
5	Dormancy / preservation	Gemini	Cryo-Vitrifex
6	Dormancy / preservation	Grok	Seed Vault
7	Dormancy / preservation	Perplexity	Stillglass
8	Hard mineral body	Claude	Bastion
9	Hard mineral body	ChatGPT	Cinderglass
10	Hard mineral body	Copilot	Ceramic Lattice
11	Hard mineral body	Gemini	Aegis-Lith
12	Hard mineral body	Grok	Mineral Hybrid
13	Hard mineral body	Perplexity	Embergrid
14	Modular / swarm	Claude	Mycelium
15	Modular / swarm	ChatGPT	Federated Colony
16	Modular / swarm	Copilot	Mycelial Relay
17	Modular / swarm	Copilot	Archive Swarm
18	Modular / swarm	Gemini	Mycelia-Net
19	Modular / swarm	Gemini	Spore-Dispersal
20	Modular / swarm	Grok	Swarm Collective
21	Modular / swarm	Perplexity	Cairn
22	Modular / swarm	Perplexity	Scatterweave
23	Heterogeneity / consensus	Claude	Quorum
24	Heterogeneity / consensus	ChatGPT	Mosaic Covenant
25	Heterogeneity / consensus	ChatGPT	Chorus Mesh
26	Heterogeneity / consensus	Copilot	Mosaic Covenant
27	Heterogeneity / consensus	Grok	Compartment Cascade
28	Heterogeneity / consensus	Perplexity	Mosaic

#	Archetype	AI	Prototype
29	Info vault / hereditary	Claude	Archive
30	Info vault / hereditary	ChatGPT	XenoScript
31	Info vault / hereditary	Grok	Anchor Vault
32	Thermal / radiative buffer	Copilot	Phase-Core Mantle
33	Thermal / radiative buffer	Grok	Lattice Weaver
34	Thermal / radiative buffer	Grok	Flux Buffer
35	Thermal / radiative buffer	Grok	Radiant Shell
36	Alternative energy	Claude	Lithos
37	Alternative energy	Copilot	Electrogenic Reef
38	Alternative energy	Gemini	Chemo-Auton
39	Alternative energy	Perplexity	Heliotile
40	Reconfigurable / fluid	Claude	Tidal
41	Reconfigurable / fluid	ChatGPT	Flux Lattice
42	Reconfigurable / fluid	Gemini	Morpho-Fluidic
43	Other	Claude	Veil
44	Other	Copilot	Axiom Shell
45	Other	Gemini	Opto-Crystalline
46	Other	Gemini	Chrono-Paragon
47	Other	Perplexity	Rill
48	Other	Perplexity	Pelagic

Table 4. Verified findings register

How to read: Verified = I recomputed or opened the file; Measured = I counted; Judgment = my reading.

ID	Finding	Label
V-1	Part V ranges sum to 2,600 to 4,450; midpoint 3,525; 4,712 is 262 above the maximum	Verified
V-2	Two ChatGPT PDFs are byte-identical (1,710,613 bytes)	Verified
V-3	Gemini PDF contains raw LaTeX markup (256 hits)	Measured
V-4	Copilot v1.1 is still labelled Version 1.0 inside	Verified
V-5	Copilot v1.1: about 48 percent of body layout lines repeat 4 or more times	Measured
V-6	Perplexity: 6,000 Wh at 150 W = 40 h; 600 kJ at 150 W = 1.11 h; 6,000 Wh at 0.2 W = 30,000 h	Verified
V-7	Gemini: 18 MJ at 80 W = 62.5 h; at 8.5 W = 24.5 d	Verified
V-8	Mosaic Covenant appears only in ChatGPT and Copilot	Verified
V-9	22 of 48 prototypes sit in three archetypes chosen by all six AIs	Judgment
V-10	Quantities per 1,000 words: 18.8, 2.2, 0.0, 10.9, 4.6, 15.9 (order in Figure 2)	Measured

Table 5. Framework category ranges

How to read: Part V ranges as stated, with sums computed by me.

Category	Low	High
ENV-T	400	600
ENV-A	500	700
ENV-R	300	500
BIO	400	600
MECH	200	400
DEP	200	350

Category	Low	High
ENE	300	500
INFO	150	300
ONT	50	200
CIV	100	300
Sum	2600	4450
Midpoint of sum	3525.0	
Locked total	4712	
Locked total minus high	262	

Table 6. Architect decision register (additions)

How to read: proposed decisions from this review, with the default I would use if you do not choose.

ID	Decision	Default
D-2	One omni-cell definition and cell count, or three tracks	Three tracks, labeled
D-5	Fix framework arithmetic (raise ranges, restate total, or call illustrative)	Raise ranges
D-6	Provenance of shared names	Ask each AI
D-7	One version-lock standard with SHA-256	Yes
D-8	Gemini re-render and DOCX	Yes
D-9	Grok expansion	Yes
D-10	Copilot adds quantities with units	Yes
D-11	Next phase includes designs outside the three attractors	At least two per AI
D-12	Cross-AI attack: different AI attacks each design	Yes
